**Notice Preparation of Environmental Impact Report
Campus Master Plan 2018
Cal State Dominguez Hills**

The California State University, Dominguez Hills will prepare an Environmental Impact Report for the Campus Master Plan 2018. The California State University Dominguez Hills (CSUDH) Campus Master Plan 2018 (Master Plan). The Master Plan retains the current campus enrollment cap of 20,000 full-time-equivalent (FTE) students and provides a framework for implementation of the University's goals and programs by identifying needed facilities and improvements for this enrollment level and addressing the University needs to the year 2035 planning horizon.

The University completed an Initial Study for the Master Plan which indicates that the project may potentially have significant environmental impacts which will be addressed in the EIR being prepared by University. The 30-day public review period for the Initial Study begins on August 17, 2017 and ends on September 15, 2017.

A public meeting to receive comments on the Initial Study are scheduled as follows:
September 6, 2017 at 5 pm at the Loker Student Union – Ballroom C located on the 3rd floor.

The Initial Study is available for public review during the public review period at the University's website at www.csudh.edu/FacilitiesMasterPlan and at the University Library at the Cal State Dominguez Hills campus.

If you wish to comment, please send your written comments so the comments are received no later than 5:00 pm, September 15, 2017 to:

HAWAII

Five missing after Army Blackhawk goes down

By Audrey Mcavoy
The Associated Press

HONOLULU » A multi-agency team scoured the ocean off Hawaii on Wednesday for five people aboard an Army helicopter that went down during a nighttime training exercise.

Officials at Wheeler Army Airfield near Honolulu reported losing communications around 10 p.m. Tuesday with the crew of a UH-60 Black Hawk, the Coast Guard said in a statement.

Honolulu Fire Department search and rescue crews found and collected pieces of helicopter fuselage and a helmet in a debris field about 2 miles off Kaena Point on Oahu.

Photos showed Army soldiers unloading suspected debris from the firefighters' boat at the harbor in the nearby town of Haleiwa.

Officials closed the state park at Kaena Point while the search was underway. Kaena is a remote spot where Oahu's northern and western coasts meet

MARCO GARCIA — THE ASSOCIATED PRESS

Military personnel gather around the Honolulu Fire Department command center at a harbor on Wednesday, in Haleiwa, Hawaii, after an Army helicopter crashed.

to form a small peninsula. The park's sandy coastline is home to a seabird colony and endangered Hawaiian monk seals. A Coast Guard plane, two helicopters and several boats were being used in the search across an area with light winds and 2-foot seas.

Two Black Hawk crews were conducting training between Kaena Point and Oahu's Dillingham Airfield northwest of Honolulu when communications were lost, officials said.

Clouds and a few showers were in the area at the time.

When You Want Home Medical Equipment, Choose From The Biggest Selection

Anything from Canes, Crutches, and Rollators, to Hospital beds— We Have it All, We Deliver, and We Set it up

When you come to Remedy Pharm, you will be amazed at the size of the selection, as well as the competent personal care that you can receive. You can find over 210 different items at all times, including...

- Over 40 different types of compression stockings in choice of colors, sizes, and strengths.
- 17 different canes, including multi-tipped
- Over 25 different kinds of

bandages for wound care

- Over 40 different kinds of braces for knees, ankles, wrists, lumbar support, and more

And that's just the tip of the iceberg. What you don't find in our vast assortment is supplemented by large selections in catalogs available in 48 hours.

We deliver, set up your equipment, show you how to use it, and help repair it if it breaks. Nowhere else can you get this assortment, service, and complete satisfaction—*guaranteed!*

Initial Study

1. **Project Title:** California State University Dominguez Hills Campus Master Plan 2018
2. **Lead Agency Name and Address:** The Board of Trustees of the California State University;
California State University, Dominguez Hills
1000 East Victoria Street
Carson, CA 90747
3. **Contact Person and Phone Number:** Roshni Thomas, Director
Planning, Design and Construction
(310) 243-3826
4. **Project Location:** California State University Dominguez Hills campus, Carson, Los Angeles County (see Figure 1)
5. **Project Sponsor's Name and Address:** Same as Lead Agency
6. **Campus Master Plan Designation:** Various academic, student housing, support, administrative, mixed-use, business park, residential, and other designations
7. **Project Description:** The project is the adoption and implementation of the California State University Dominguez Hills (CSUDH) Campus Master Plan 2018 (Master Plan). The Master Plan retains the current campus enrollment cap of 20,000 full-time-equivalent (FTE) students and provides a framework for implementation of the University's goals and programs by identifying needed facilities and improvements for this enrollment level and addressing the University needs to the year 2035 planning horizon.

University Objectives: The main objective of the Master Plan is to guide the long-term land use development of the campus over the next 20 years. To do so, the Master Plan creates a physical campus environment that facilitates the University's ability to achieve the following objectives:

- Reinforce the University's focus on teaching and learning by providing the appropriate instructional, research, and administrative facilities that support the depth of knowledge the University seeks to instill
- Support opportunities for interaction and collaboration among students, faculty, staff, community members and campus visitors
- Incorporate new technologies and welcoming, socially responsible physical environments
- Make efficient use of developable land and add additional uses to the campus to further engage with the surrounding community and provide further opportunities for its students, faculty, and staff
- Create the appropriate balance between built-up areas and open space

Project Characteristics: The Master Plan Land Use Map (Figure 2) shows the planned land uses. It indicates both areas where uses will change from current activities and areas where future facilities will be developed. Included in the use categories are academic functions, student housing and student support areas, mixed use, residential, and business park areas. Recreation and athletics locations and major natural and open spaces are also indicated. The map illustrates location, adjacency, and scale of future facilities and improvements that are planned to be developed over the next 20 years.

Figure 2
Master Plan Land Use Map

Source: Draft Campus Master Plan 2018

The 346-acre campus is comprised of three major areas: the Core Campus with academic facilities, a planned new University Village, and the existing StubHub Center. The Master Plan provides for new facilities and features within these areas. These facilities and features were formulated and designed in response to the Master Plan objectives and specific needs identified throughout a comprehensive Master Plan development process guided by a Master Plan Steering Committee representing faculty, administration, students and staff, and by input from the campus community and stakeholders through a comprehensive public outreach process of community meetings.

Core Campus: The Core Campus comprises the central portion of the campus, extending from Victoria Street to University Avenue. As illustrated in Figure 3, the Master Plan provides for the best use of the existing facilities and for new, appropriately situated facilities and features, including:

- 12 new academic and administrative facilities, providing classrooms, laboratories, faculty and administrative offices, new performing arts facilities; a new incubator/research facility; and facilities for accommodating CSUDH’s mobile Fabricator Lab vehicles
- Student support facilities, including an expansion of the Loker Student Union, new student residence halls and a new student recreation center
- Athletic facilities including a remodeled Gymnasium and existing and new playfields;
- Campus support facilities, including a new, expanded Child Care Center; new Facilities Services offices and yards; an expansion of the existing Central Plant; and a satellite central plant
- Parking facilities to accommodate 20,000 FTEs, including reconfigured surface lots and new parking structures
- Reconfigured north campus entry at Tamcliff Drive and Victoria Street; a reinforced campus entry at Toro Center Drive and University Avenue; and reconfigured vehicle access to parking facilities
- Open space areas for campus activities, programmed and informal gathering and recreation

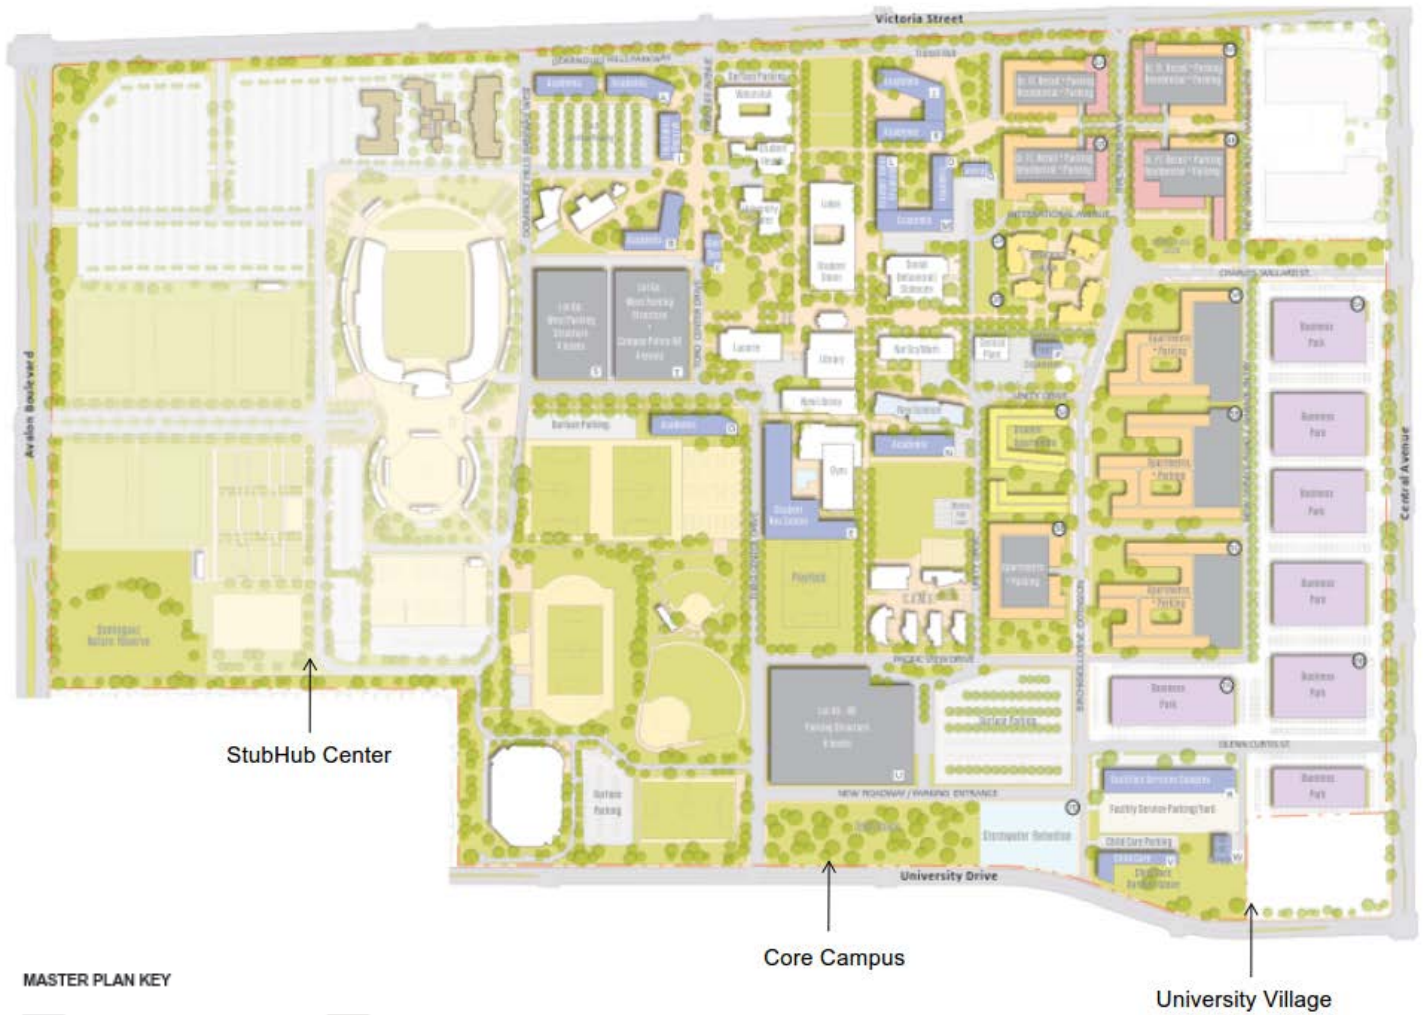

University Village: The University Village comprises the most eastern campus area, extending from Victoria Street to south of Glenn Curtis Drive. As illustrated in Figure 3, the Master Plan provides for a new mixed use development of this area that includes:

- Retail uses to support both the Core Campus and the University Village, including some on-street parking and parking in structures
- Market-rate housing and parking, including housing for faculty and staff and apartment style housing for students
- Business park development targeted to uses compatible with and supportive of the University’s educational mission
- Open space areas for informal activities, leisure, gathering and recreation

- Vehicle circulation improvements including an extension of Birchknoll Drive from Victoria Street to University Avenue, and reconfigured vehicle access from Central Avenue via Charles Willard Drive and Glenn Curtis Drive

StubHub Center: The existing StubHub Center is located the western-most area, east of Avalon Boulevard. The Center's facilities include an existing stadium with seating for 27,000 spectators. The Master Plan provides for additional 3,000 seats for seating for 30,000 spectators at the stadium.

**Figure 3
Master Plan Facilities**

MASTER PLAN KEY

- | | | | |
|---|------------------------------|---|---------------------------------|
|  | EXISTING CAMPUS BUILDING |  | MARKET-RATE APARTMENTS |
|  | PROPOSED NEW CAMPUS BUILDING |  | GROUND FLOOR RETAIL |
|  | BUILDING UNDER CONSTRUCTION |  | BUSINESS PARK |
|  | OTHER BUILDING |  | NEW STUDENT APARTMENTS |
|  | PARKING STRUCTURE |  | NEW RESIDENCE HALLS |
|  | SURFACE PARKING LOT |  | LDP PARCEL DESIGNATION |
|  | PEDESTRIAN PATH |  | NEW CAMPUS FACILITY DESIGNATION |

Housing: Providing appropriate opportunities for students to live on campus is an important component of the Master Plan. The Master Plan provides for replacement of older student housing facilities and for new student residence halls and student apartments within both the Core Campus and the University Village, providing approximately 940 new additional student beds on campus.

The Master Plan also provides for new housing with up to 2,150 apartment units within the University Village that will be made available for faculty, staff, graduate students, and the general public.

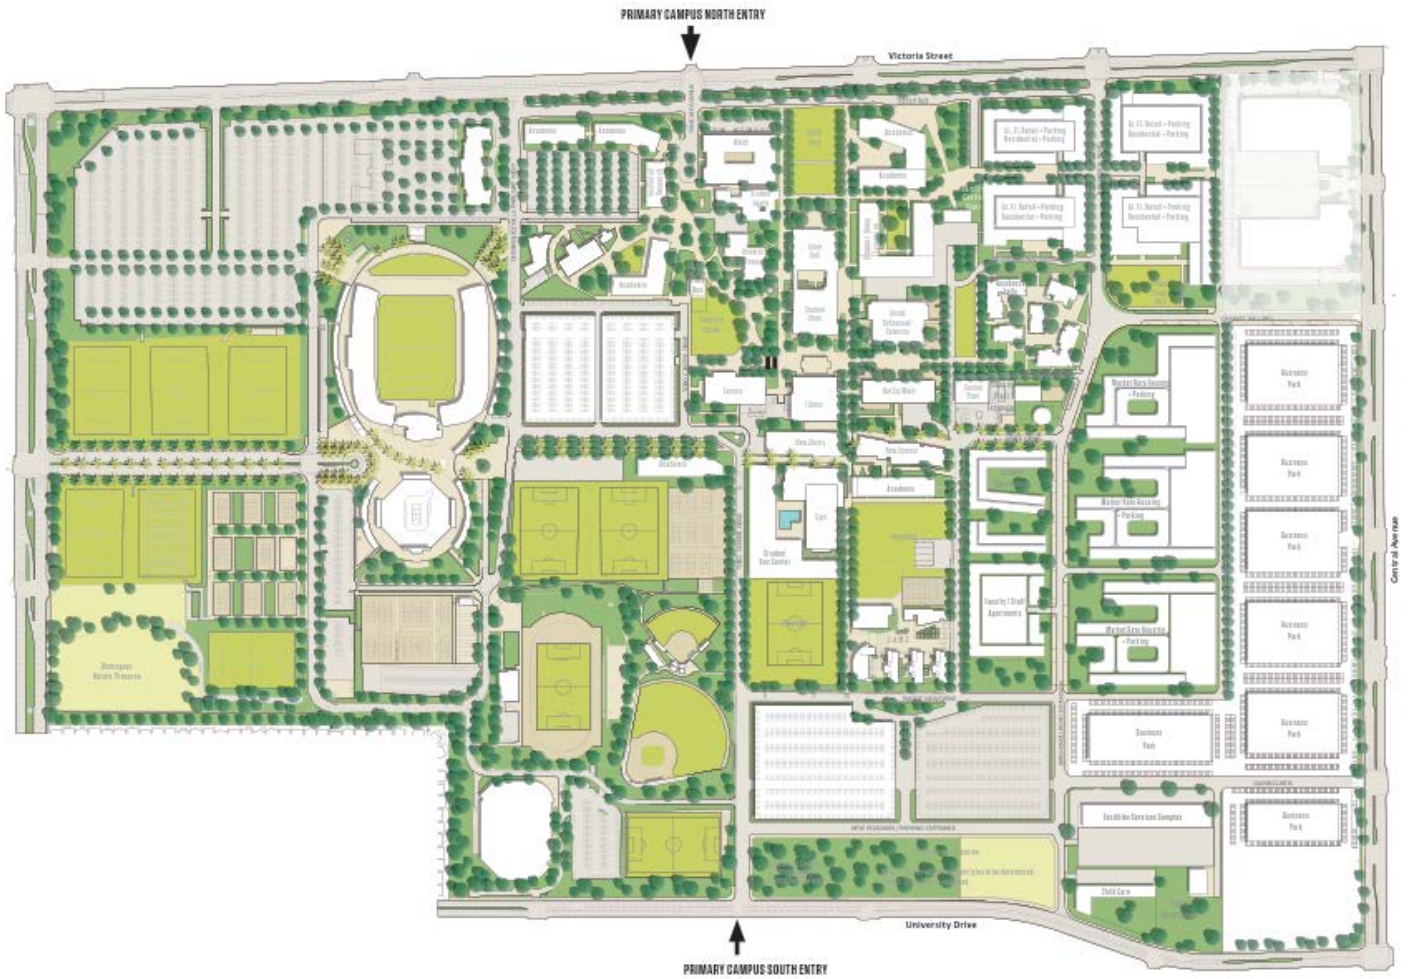

Mixed Use Development: In addition to housing, the University Village will include up to 721,000 square feet of business park facilities and 96,000 square feet of retail uses serving the Village residents and employees.

Landscape: The Master Plan creates a holistic framework for the campus outdoor environment to achieve the following goals:

- Increasing sustainability of the campus landscape
- Increasing plant biodiversity
- Developing visual identity and wayfinding
- Improving connectivity of circulation modes

As illustrated in Figure 4, the landscape plan continues to highlight historic campus open areas, creates strong identity for campus corridors, and provides for enhanced landscape coherence and plant diversity at campus edges, plazas, courtyards, and quadrangles. The landscape plan reduces the overall extent of turf grass within the campus and provides for climate-appropriate plant palettes, enhancing the campus' sustainability.

**Figure 4
Master Plan Landscape Map**

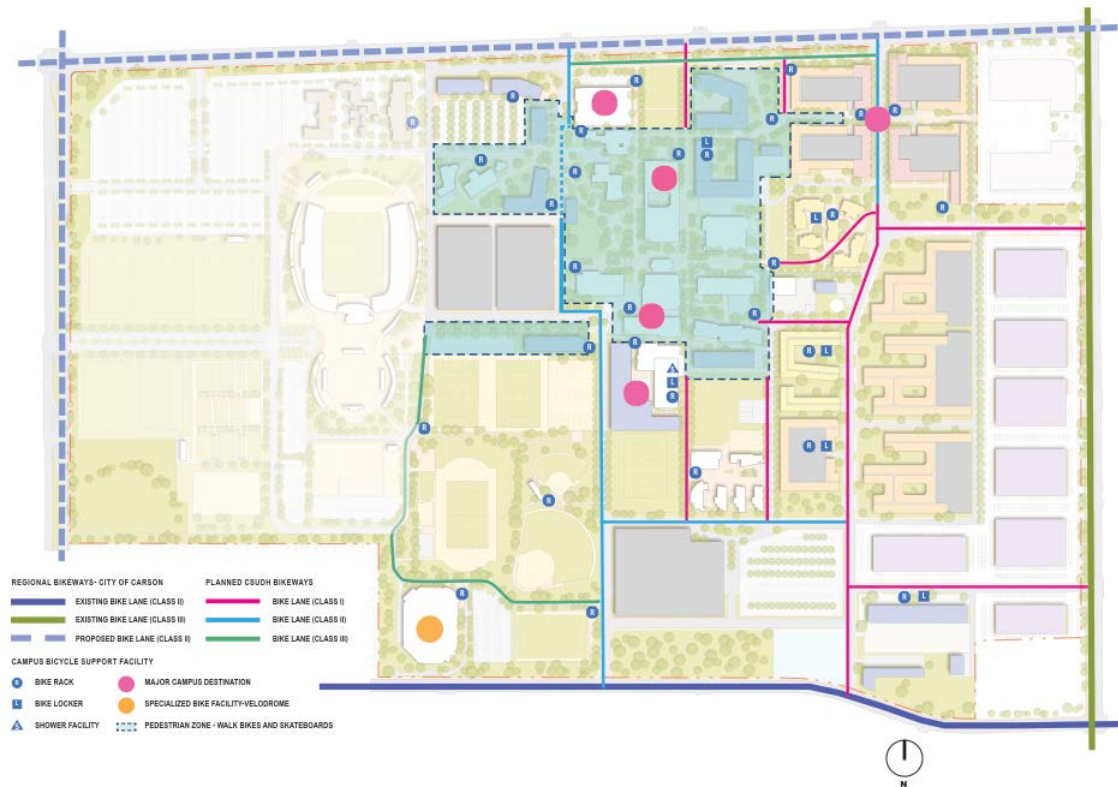

Circulation: The Master Plan emphasizes and provides for an enhanced pedestrian and bicycle circulation throughout the campus, tied together with an enhanced vehicle circulation system that better distributes arriving and departing traffic and addresses pedestrian and bicycle safety and, as illustrated in Figures 5 and 6. This pedestrian and bicycle plans include new and upgraded paths, lanes, and routes, as well as the provision of bicycle racks and other amenities for pedestrians and bicyclists. The existing commuter/transit hub on the Dominguez Hills Parkway frontage road along the northern edge of the campus will continue to support the range of public transit services serving the campus, as well as the Toro Express campus shuttle.

Figure 5
Vehicle and Pedestrian Circulation

**Figure 6
Bicycle Circulation**

Sustainability: The Master Plan incorporates sustainability guidelines for all future campus development. The guidelines address energy efficiency, water efficiency, stormwater management, transportation that reduces vehicular trips and travel, waste management, and the overall enhanced resiliency of the campus’ facilities, operating systems, and infrastructure.

8. Surrounding Land Uses and Setting: The CSU Dominguez Hills 346-acre campus is located in the City of Carson, in Los Angeles County (see Figure 1). The campus is separated from the existing surrounding residential development to the north by Victoria Street, to the south by Avalon Boulevard and on the east by Central Avenue. Central Avenue abuts a series of industrial park buildings and provides access to the campus from State Route (SR) -91 freeway.

9. CSU and Other Public Agencies whose approval will be sought:

- CSU Board of Trustees
 - Approval and adoption of the Campus Master Plan
 - Approval of public-private partnership(s) for development of housing and business park uses
 - Approval of conceptual and schematic plans for future facilities and improvements

Others, as may be necessary

- City of Carson
Approval of any improvements within the City rights-of-way
Approval of new local sewer connections and/or increase in quantity, as needed
Others, as may be necessary
- California Water Service Company
Approval of increase in quantity or new water connections
- Sanitation Districts of Los Angeles County
Approval of increase in quantity and/or new sewer connections
- Regional Water Quality Control Board
Compliance with NPDES permit
- Division of State Architect
Approval of accessibility for future facilities
- State Fire Marshall
Fire safety review and approval of future facilities and improvements
- Others, as may be necessary

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|--|---|--|
| <input checked="" type="checkbox"/> Aesthetics | <input type="checkbox"/> Agriculture and Forestry Resources | <input checked="" type="checkbox"/> Air Quality |
| <input checked="" type="checkbox"/> Biological Resources | <input checked="" type="checkbox"/> Cultural and Tribal Resources | <input checked="" type="checkbox"/> Greenhouse Gas Emissions |
| <input type="checkbox"/> Geology /Soils | <input type="checkbox"/> Hazards & Hazardous Materials | <input type="checkbox"/> Hydrology / Water Quality |
| <input type="checkbox"/> Land Use / Planning | <input type="checkbox"/> Mineral Resources | <input checked="" type="checkbox"/> Noise |
| <input checked="" type="checkbox"/> Population / Housing | <input checked="" type="checkbox"/> Public Services | <input checked="" type="checkbox"/> Recreation |
| <input checked="" type="checkbox"/> Transportation/Traffic | <input checked="" type="checkbox"/> Utilities / Service Systems | <input checked="" type="checkbox"/> Mandatory Findings of Significance |

Determination

On the basis of this initial evaluation:

- I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

 Signature	 Date
--	---

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
I. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>a through d. The Cal State Dominguez Hills campus is located in a developed urban area that does not provide scenic vistas, and the campus is not located within a State scenic highway. Campus development with new facilities and improvements pursuant to the Master Plan will result in a more urban visual character, particularly within the campus' eastern area. Therefore, the aesthetic effect of these planned facilities, and any needed mitigation, will be addressed in the EIR.</p>				
<p>II. AGRICULTURE AND FOREST RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement technology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:</p>				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources section 4256) or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
a through e. The campus does not contain farmland or forest land. No property under Williamson Act contract or land designated as forest land exists on the campus. Future development pursuant to the Master Plan will not involve any changes to the existing environment that could result in conversion of farmland or forest land to other uses. No impact will result and these issues will not be addressed in the EIR.				
III. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a through d. While the Master Plan is anticipated to reduce commute vehicular travel by students, faculty and staff that generate air pollutants through the provision of additional student housing and amenities on campus, the campus development has the potential to generate additional vehicular trips associated with the University Village community housing and business park component, and short-term emissions associated with construction of new facilities and improvements. Therefore, these issues will be evaluated in the EIR.</p>				
<p>e. The campus development and operations are not associated with the generation of objectionable odors that could affect a substantial number of people. No adverse impact will result.</p>				
<p>IV. BIOLOGICAL RESOURCES -- Would the project:</p>				
<p>a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?</p>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?</p>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
a through f. The Master Plan includes the continuing preservation of the Dominguez Nature Reserve and Monarch Garden natural open space areas. However, since the Master Plan provides for long-term development of new facilities and improvements within the campus areas that are currently partly developed, these issues, and any needed mitigation, will be evaluated in the EIR.				
V. CULTURAL AND TRIBAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a through d. There is one historic building on campus – the Leo Cain Library, which will not be affected by the future campus development. No other cultural resources and no known tribal resources exist on campus. However, since the campus development pursuant to the Master Plan involves replacement of some older facilities that have become functionally obsolete and development of new facilities and improvements in campus areas that are currently partly developed, the issue of cultural and tribal resources, and any needed mitigation, will be evaluated in the EIR.</p>				
VI. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
ii) Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iii) Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iv) Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
<p>a. through d. There are no known faults within the CSU Dominguez Hills campus. However, the campus is located in the seismically active Southern California region, in proximity to the Newport-Inglewood fault. Therefore, all design and construction of new facilities and improvements will be in strict compliance with the California State University seismic safety standards and requirements. This includes (1) conducting site-specific geotechnical investigations, (2) site-specific seismic design of all new facilities and improvements, (3) using engineering techniques for site-specific soil conditions in construction of all new facilities and improvements developed pursuant to the Master Plan. Each planned facility undergoes an independent peer review process to ensure that all CSU seismic safety requirements are incorporated into design and construction. With mandatory compliance with these requirements and the use of appropriate engineering and design techniques all campus new facilities and improvements will provide the required level of seismic safety. The campus is located on relatively flat terrain; thereby it is not at risk for landslides. Impact will be less than significant and these issues will not be addressed further in the EIR.</p>				
<p>e. The campus is served by sewer systems and no septic tanks or alternative wastewater disposal systems are needed. No impact will result.</p>				
<p>VII. GREENHOUSE GAS EMISSIONS -- Would the project:</p>				
<p>a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?</p>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>b) Conflict with applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a and b. The Master Plan is intended to accommodate the continuing growth in student enrollment resulting from regional growth in population, housing, and employment over the next 20 years. In addition, the Master Plan aims to reduce overall emissions, including greenhouse (GHG) emissions, by housing more students on campus and reducing commute vehicular travel, and implementing environmental stewardship and sustainability measures intended to reduce vehicle and energy use that will have a beneficial effect of reducing GHG. In addition, the Master Plan reinforces locations of the nearby transit centers that facilitate transit use and further reduce commute trips. The Master Plan will not conflict nor obstruct the implementation of the South Coast Air Quality Management Plan which aims at reducing overall emissions, including greenhouse gas (GHG) emissions. However, since development of community housing and business park uses pursuant to the Master Plan has the potential to generate additional vehicular trips, and campus development will result in short-term construction emissions, which include GHG, associated with development of new facilities and improvements, these issues will be evaluated in the EIR.</p>				
<p>VIII. HAZARDS AND HAZARDOUS MATERIALS -- Would the project:</p>				
<p>a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
<p>a through c. For most of the new facilities on-site use and storage of hazardous materials will be limited to small amounts of everyday household cleaners and common chemicals used for landscaping and maintenance. Materials used for laboratory academic research and instructions will be handled and disposed of in accordance with established University safety procedures, ensuring safe and lawful handling, movement, storage, and disposal. Impact will be less than significant and these issues will not be addressed further in the EIR.</p>				
<p>d. The campus is not included on the Department of Toxic Substances Control Hazardous Waste and Substance List (Cortese List) or any other list of hazardous materials sites. No impact will result.</p>				
<p>e and f. The campus is not located within two miles of a public use airport or private airport. No impact will result.</p>				
<p>g. All new facilities developed pursuant to the Master Plan will include the provision of all necessary emergency access in compliance with existing regulations. Therefore, the project will not impair implementation nor physically interfere with any adopted emergency response or evacuation plans. No impact will result.</p>				
<p>h. The campus is located within a highly urbanized area and away from hillside and is not subject wildfire hazards. No impact will result.</p>				
<p>IX. HYDROLOGY AND WATER QUALITY -- Would the project:</p>				
<p>a) Violate any water quality standards or waste discharge requirements?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
<p>c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Otherwise substantially degrade water quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
j) Inundation by seiche, tsunami, or mudflow?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a, c through f. The Master Plan includes development of new facilities and improvements that will result in additional runoff. While all new development will include all necessary drainage improvements, and the Master includes a new stormwater retention basin and the use of bioswales in new development, the issues of drainage will be evaluated in the EIR.</p>				
<p>b. The implementation of the Master Plan is not expected to result in substantially increased groundwater pumping since there are no groundwater wells on campus and groundwater is not the direct source of water for the campus. No significant impact will result.</p>				
<p>g through i. The National Flood Insurance Rate Maps do not identify 100-year flood hazard areas within the campus. The closest designated flood zone is along the Dominguez Channel to the southeast of the campus. No adverse impact will result.</p>				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
<p>j. The campus is located inland and is not subject to tsunamis, nor is it subject to a seiche as it is not located near a large body of water. The campus is not subject to mudflows as it is relatively flat and not located adjacent to hillsides. No impact will result.</p>				
<p>X. LAND USE AND PLANNING -- Would the project:</p>				
<p>a) Physically divide an established community?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>c) Conflict with any applicable habitat conservation plan or natural community conservation plan?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a through c. The Master Plan provides for new facilities and improvements within the campus and will not physically divide an established community. No other land use plans apply to the campus and no adverse impact will result.</p>				
<p>XI. MINERAL RESOURCES -- Would the project:</p>				
<p>a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a and b. No mineral resources are known to exist on the CSU Dominguez Hills campus. No impact will result.</p>				
<p>XII. NOISE -- Would the project result in:</p>				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a, c through d. Implementation of the Master Plan will result in noise associated with construction of new facilities and improvements, day-to-day campus activities, and residential and business park uses. These issues will be addressed in the EIR.</p>				
<p>b. The long-term facilities and improvements provided pursuant to the Master Plan will continue the University uses and functions that do not involve generating excessive vibration or groundborne noise. No adverse impact will result and this issue will not be addressed in the EIR.</p>				
<p>e and f. The campus is not located within an airport land use plan, within two miles of an airport or public use airport, or within the vicinity of a private airstrip. No impact will result.</p>				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
XIII. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a. The Master Plan provides for additional student and faculty and staff housing, the opportunity for community housing through provision of “market rate” housing on campus, and business park facilities that provide employment opportunities. While the provision of additional housing and employment opportunities has no potential to significantly affect long-term population, housing, and employment within the Los Angeles County region, it could affect such growth within the nearby areas. Therefore, these issues will be evaluated in the EIR.</p>				
<p>b and c. The Master Plan does not involve the removal of housing or displacement of people. No impact will result.</p>				
XIV. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Police protection?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Schools?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Parks?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
Other public facilities?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>a. The Master Plan provides for needed facilities and improvements to accommodate the projected student enrollment over the next 20 years, as well as for new housing and business park uses that will generate additional demand for fire, police protection, and other public services. Potential impact on these services will be evaluated in the EIR.</p>				
<p>XV. RECREATION</p>				
<p>a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?</p>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<p>b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?</p>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
<p>a and b. Implementation of the Master Plan is not anticipated to result in the construction of new parks or recreational facilities that might have an adverse physical effect on the environment. However, as the Master Plans provides for community housing in the eastern campus area that may result in an increased use of existing recreation facilities by their future residents, these issues will be evaluated further in the EIR.</p>				
<p>XVI. TRANSPORTATION/TRAFFIC -- Would the project:</p>				
<p>a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?</p>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Conflict with applicable congestion management program, including but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location which results in substantial safety risks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Conflict with adopted policies plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the safety of such facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a and b. The Master Plan provides for additional student and faculty housing on campus and continued use of public transit which will reduce commuter vehicular trips to campus. However, since the Master Plan also provides for development of the eastern area of the campus within the University Village with new housing that will be made available for faculty, staff, graduate students, and the general public, and with business park uses that will result in vehicular trips, a traffic study will be prepared as part of the EIR to address these issues.</p>				
<p>c through f. The provision of University facilities and improvements will not affect air traffic patterns. The new facilities and improvements pursuant to the Master Plan will include the provision of all required emergency access in compliance with existing regulations. No design features or uses that could result in increased hazards are part of the Master Plan. The Master Plan provides for enhanced use of public transit and bicycles, and enhanced pedestrian circulation supporting the University's alternative transportation programs and policies. No adverse impact will result and these issues will not be addressed further in the EIR.</p>				
<p>XVII. UTILITIES AND SERVICE SYSTEMS -- Would the project:</p>				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
g) Comply with federal, State, and local statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a. The new facilities and uses developed pursuant to the Master Plan will generate wastewater of similar quality to that generated by the campus' existing facilities. The quality of the wastewater flows associated with these typical urban uses meet all applicable requirements. No adverse impact will result and this issue will not be addressed in the EIR.</p>				
<p>b through e. The new facilities and improvements developed pursuant to the Master Plan will use water and generate wastewater, and the new facilities in campus' areas that are not fully developed will generate additional stormwater flows. Therefore, these issues will be evaluated in the EIR.</p>				
<p>f and g. The University implements a recycling program to minimize the amount of solid waste disposed at the landfills. The recycling program and other waste-reduction measures will continue to be implemented in additional uses and facilities developed pursuant to the Master Plan. Nonetheless, since the development pursuant to the Master Plan will generate solid waste, these issues will be further addressed in the EIR.</p>				

Issues:	Potentially Significant Impact	Less Than Significant Impact with Mitigation Incorporated	Less Than Significant Impact	No Impact
XVIII. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
<p>a. Implementation of the Master Plan will result in additional facilities and improvements within the campus. No important examples of California history or prehistory are known to be present within areas the campus where new development may occur, and the Master Plan includes the continuing preservation of the Dominguez Nature Reserve and the Monarch Garden natural open space areas. However, since the Master Plan provides for long-term development of new facilities and improvements within the campus areas that are currently not fully developed, these issues, and any needed mitigation, will be evaluated in the EIR.</p>				
<p>b. The future area-wide growth and development over the next 20 years, including the campus development pursuant to the Master Plan, may result in significant cumulative air quality, traffic, noise, and other impacts. Therefore, these issues will be evaluated in the EIR.</p>				
<p>c. The Master Plan will result in the provision of needed facilities and improvements at the CSU Dominguez Hills campus. These facilities and improvements are necessary to continue the University functions and the provision of higher education opportunities to the residents of the surrounding areas and the state, with no potential to result in substantial adverse effects on people.</p>

**NOTICE OF PREPARATION (NOP) FOR A DRAFT ENVIRONMENTAL IMPACT
REPORT (EIR) FOR CAMPUS MASTER PLAN 2018 PROJECT
(CALIFORNIA STATE UNIVERSITY, DOMINGUEZ HILLS) (SCH# 2017081035)**

Dear Ms. Thomas:

The Department of Toxic Substances Control (DTSC) has reviewed the subject NOP. The following project description is stated in the NOP: "The project is the adoption and implementation of the California State University Dominguez Hills (CSUDH) Campus Master Plan 2018 (Master Plan). The Master Plan retains the current campus enrollment cap of 20,000 full-time-equivalent (FTE) students and provides a framework for implementation of the University's goals and programs by identifying needed facilities and improvements for this enrollment level and addressing the University needs to the year 2035 planning horizon."

Based on the review of the submitted document DTSC has the following comments:

1. The EIR should identify and determine whether current or historic uses at the project site may have resulted in any release of hazardous wastes/substances. A Phase I Environmental Site Assessment may be appropriate to identify any recognized environmental conditions.
2. If there are any recognized environmental conditions in the project area, then proper investigation, sampling and remedial actions overseen by the appropriate regulatory agencies should be conducted prior to the new development or any construction.
3. If the proposed project involves the demolition of existing structures, lead-based paints or products, mercury, and asbestos containing materials (ACMs) should

Ms. Roshni Thomas, Director

August 28, 2017

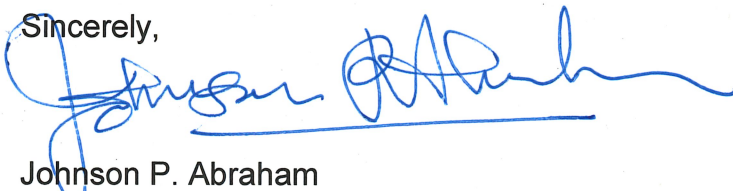

Page 2

be addressed in accordance with all applicable and relevant laws and regulations if buildings are modified/demolished.

4. If the site was used for agricultural or related activities, residual pesticides may be present in onsite soil. DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from residual pesticides.
5. DTSC recommends evaluation, proper investigation and mitigation, if necessary, on onsite areas with current or historic PCB-containing transformers.
6. If the project plans include discharging wastewater to a storm drain, you may be required to obtain an NPDES permit from the overseeing Regional Water Quality Control Board (RWQCB).
7. If the project development involves soil export/import, proper evaluation is required. If soil contamination is suspected or observed in the project area, then excavated soil should be sampled prior to export/disposal. If the soil is contaminated, it should be disposed of properly in accordance with all applicable and relevant laws and regulations. In addition, if imported soil was used as backfill onsite and/or backfill soil will be imported, DTSC recommends proper evaluation/sampling as necessary to ensure the backfill material is free of contamination.
8. If during construction/demolition of the project, soil and/or groundwater contamination is suspected, construction/demolition in the area should cease and appropriate health and safety procedures should be implemented. If it is determined that contaminated soil and/or groundwater exist, the EIR should identify how any required investigation and/or remediation will be conducted, and the appropriate government agency to provide regulatory oversight.

If you have any questions regarding this letter, please contact me at (714) 484-5380 or email at Johnson.Abraham@dtsc.ca.gov.

Sincerely,

Johnson P. Abraham

Notice of Preparation

August 17, 2017

To: Reviewing Agencies

Re: Campus Master Plan 2018
SCH# 2017081035

Attached for your review and comment is the Notice of Preparation (NOP) for the Campus Master Plan 2018 draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Roshni Thomas
California State University, Dominguez Hills
1000 E. Victoria Street
Carson, CA 90747-0005

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

RE: SCH# 2017081035; Campus Master Plan 2018 Project, City of Carson; Los Angeles County, California

Dear Mr. Thomas:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for Draft Environmental Impact Report for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit. 14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd. (a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a **separate category of cultural resources**, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (Pub. Resources Code § 21084.2). Please reference California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," <http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf>. Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends **lead agencies consult with all California Native American tribes** that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.**

SEP 1 '17 AM 8:08

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
 - a. A brief description of the project.
 - b. The lead agency contact information.
 - c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
 - d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).
2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
 - a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).
3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
 - a. Alternatives to the project.
 - b. Recommended mitigation measures.
 - c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).
4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
 - a. Type of environmental review necessary.
 - b. Significance of the tribal cultural resources.
 - c. Significance of the project's impacts on tribal cultural resources.
 - d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).
5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).
6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
 - a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
 - b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
 - a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
 - b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
 - a. Avoidance and preservation of the resources in place, including, but not limited to:
 - i. Planning and construction to avoid the resources and protect the cultural and natural context.
 - ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
 - b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - i. Protecting the cultural character and integrity of the resource.
 - ii. Protecting the traditional use of the resource.
 - iii. Protecting the confidentiality of the resource.
 - c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
 - d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
 - e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
 - f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
 - a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
 - b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
 - c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

This process should be documented in the Cultural Resources section of your environmental document.

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires **local governments** to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. **Tribal Consultation:** If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. **No Statutory Time Limit on SB 18 Tribal Consultation.** There is no statutory time limit on SB 18 tribal consultation.
3. **Confidentiality:** Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. **Conclusion of SB 18 Tribal Consultation:** Consultation should be concluded at the point in which:
 - a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
 - b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - a. If part or all of the APE has been previously surveyed for cultural resources.
 - b. If any known cultural resources have been already been recorded on or adjacent to the APE.
 - c. If the probability is low, moderate, or high that cultural resources are located in the APE.
 - d. If a survey is required to determine whether previously unrecorded cultural resources are present.
2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

- b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.
3. Contact the NAHC for:
- a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.
4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
- a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
 - b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
 - c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Please contact me if you need any additional information at gayle.totton@nahc.ca.gov.

Sincerely,

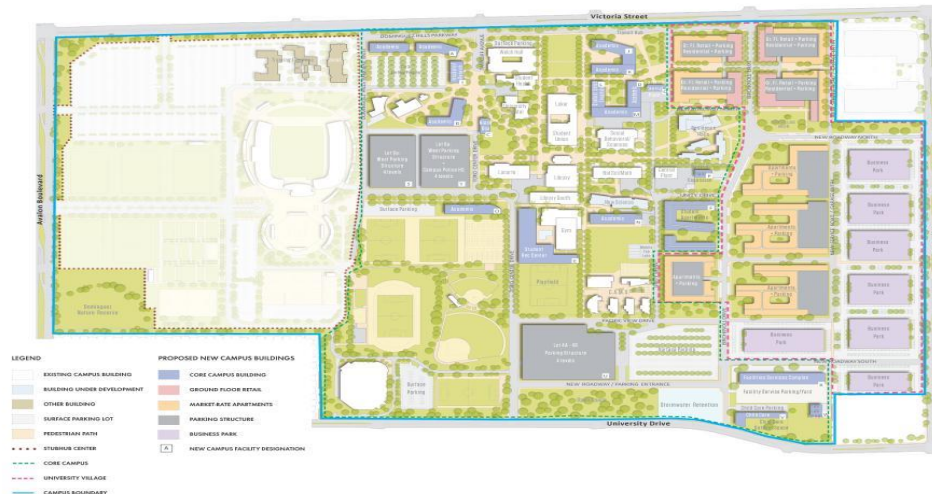

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

A.7 Notice of Availability Draft EIR

2018 Campus Master Plan
at the California State University, Dominguez Hills
Announcement of Availability of Draft Environmental Impact Report
for Public Review and Comment

WHAT IS BEING PLANNED?

The project is the adoption and implementation of the California State University, Dominguez Hills (CSUDH or University) 2018 Campus Master Plan (proposed project). The proposed project provides a framework for development of the University’s physical campus and its facilities to accommodate campus enrollment growth from its current enrollment of approximately 11,000 full-time-equivalent students (FTES) to 20,000 FTES over a planning horizon extending to 2035. In conjunction with the proposed project, CSUDH also has prepared its Guidelines for the 2018 Campus Master Plan (Guidelines) to support and advance the University’s vision of developing a vital campus that supports the facilities, buildings, improvements, and services needed for a top-performing model urban university to serve up to 20,000 full-time students.

The proposed project entails the development of new and expanded facilities in three areas of the 344-acre campus: (i) the Core Campus; (ii) the University Village; and (iii) a 3,000-seat expansion of the StubHub Center.

WHY THIS NOTICE?

The Board of Trustees of the California State University and California State University, Dominguez Hills has studied the effects this project may have on the environment and has completed the **Draft Environmental Impact Report (DEIR)**, which evaluates the potential impacts of a the proposed project. This notice is to tell you a **DEIR** has been prepared and is available for you to read and comment on, as well as to notify you about a public meeting in which you may submit comment.

WHAT IS AVAILABLE?

The **Draft Environmental Impact Report** and the related technical studies are available for public review from February 11, 2019 to March 29, 2019. Maps and other information are also available. There are also copies of the documents available at at CSUDH (1000 E. Victoria Street, Carson, CA 90747) at its Leo F. Cain Library and in the Facilities Planning, Design and Construction Office, at the Carson Public Library (151 E Carson St, Carson, CA 90745), and at the Dr. Martin Luther King, Jr. Public Library (17906 S Avalon Blvd, Carson, CA 90746). The report can also be accessed from the CSUDH website: <https://www.csudh.edu/fpcm/campus-master-plan-update/>

WHERE YOU COME IN

Your comments will be a part of the public record. If you wish to make a comment on the documents, you may submit your written comments until March 29, 2019 within the 45-day public review period. Your input is important for us to finalize the environmental document and potential mitigation measures. We encourage you to review and comment on the DEIR. You may send your comments to Jay W. Bond, University Planning Consultant 1000 E. Victoria Street, WH B470, Carson, CA 90747 or to the following e-mail address: masterplan2018@csudh.edu. If you have any questions, you may call (310) 243-3750. A **public meeting** will be held on March 7, 2019 between 6:30 p.m. and 8:00 p.m. at the Juanita Millender-McDonald Community Center, 801 E. Carson Street, Carson, CA to further explain the project and collect comments.

SPECIAL ACCOMMODATIONS

For individuals who require special accommodations (American Sign Language or other lingual interpreter, accessible seating, documentation in alternate formats, etc), contact (310) 243-3750. TDD users may contact the California Relay Service TDD line at 1-800-735-2929.

Not applicable.

Project Description: *(please use a separate page if necessary)*

The project is the adoption and implementation of the California State University, Dominguez Hills (CSUDH or University) 2018 Campus Master Plan (proposed project). The proposed project provides a framework for development of the University's physical campus and its facilities to accommodate campus enrollment growth from its current enrollment of approximately 11,000 full-time-equivalent students (FTES) to 20,000 FTES over a planning horizon extending to 2035.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

Reviewing Agencies Checklist

Lead Agencies may recommend State Clearinghouse distribution by marking agencies below with and "X". If you have already sent your document to the agency please denote that with an "S".

ANNOUNCEMENT OF AVAILABILITY OF THE CALIFORNIA STATE UNIVERSITY, DOMINGUEZ HILLS 2018 CAMPUS MASTER PLAN DRAFT ENVIRONMENTAL IMPACT REPORT

FOR PUBLIC REVIEW AND COMMENT

Proposed Project: The Board of Trustees of the California State University has completed the Draft Environmental Impact Report (DEIR) for the proposed California State University, Dominguez Hills (CSUDH) 2018 Campus Master Plan (proposed project). The document evaluates the potential impacts the proposed project may have on the environment. The proposed project provides a framework for development of the University's physical campus and its facilities to accommodate campus enrollment growth from its current enrollment of approximately 11,000 full-time-equivalent students (FTES) to 20,000 FTES over a planning horizon extending to 2035. In conjunction with the proposed project, CSUDH also has prepared its Guidelines for the 2018 Campus Master Plan (Guidelines) to support and advance the University's vision of developing a vital campus that supports the facilities, buildings, improvements, and services needed for a top-performing model urban university to serve up to 20,000 full-time students.

Public Review Period: The 45-day public review period for the draft EIR begins on February 11, 2019 and ends on March 29, 2019.

Where to find the draft EIR: The DEIR is available at CSUDH (1000 E. Victoria Street, Carson, CA 90747) in the Leo F. Cain Library and the Facilities Planning, Design and Construction Office, at the Carson Public Library (151 E Carson St, Carson, CA 90745), and at the Dr. Martin Luther King, Jr. Public Library (17906 S Avalon Blvd, Carson, CA 90746). The report can also be accessed from the CSUDH website: <https://www.csudh.edu/fpcm/campus-master-plan-update/>.

If you would like to comment, please send your written comments no later than March 29, 2019 to Jay W. Bond, University Planning Consultant, 1000 E. Victoria Street, Carson, CA 90747 or to the following e-mail address: masterplan2018@csudh.edu. If you have any questions, call (310) 243-3750.

A.10 Notice of Availability Extended; SCH stamped form

**2018 Campus Master Plan
at the California State University, Dominguez Hills
Announcement of Extended Public Review Period
Draft Environmental Impact Report**

Governor's Office of Planning & Research

FEB 27 2019

STATE CLEARINGHOUSE

On February 11, 2019, the Board of Trustees of the California State University provided public notice of availability of a **Draft Environmental Report (DEIR)** for the proposed **California State University, Dominguez Hills (CSUDH) 2018 Campus Master Plan** (proposed project). The public review period commenced on February 11, 2019 and was scheduled to conclude on March 29, 2019. Due to an unanticipated formatting error in DEIR Appendix F.1 (Transportation Impact Study), which was corrected as of February 26, 2019, the public review period has been extended and now ends on **April 15, 2019**.

WHAT IS BEING PLANNED?

The project is the adoption and implementation of the proposed project, which provides a framework for development of the University's physical campus and its facilities to accommodate campus enrollment growth from its current enrollment of approximately 11,000 full-time-equivalent students (FTES) to 20,000 FTES over a planning horizon extending to 2035. In conjunction with the proposed project, CSUDH also has prepared its Guidelines for the 2018 Campus Master Plan (Guidelines) to support and advance the University's vision of developing a vital campus that supports the facilities, buildings, improvements, and services needed for a top-performing model urban university to serve up to 20,000 full-time students.

The proposed project entails the development of new and expanded facilities in three areas of the 344-acre campus: (i) the Core Campus; (ii) the University Village; and (iii) a 3,000-seat expansion of the StubHub Center.

WHAT IS AVAILABLE?

The **Draft Environmental Impact Report** and the related technical studies are available for public review from February 11, 2019 to April 15, 2019. Maps and other information are also available. There are also copies of the documents available at CSUDH (1000 E. Victoria Street, Carson, CA 90747) at its Leo F. Cain Library and in the Facilities Planning, Design and Construction Office, at the Carson Public Library (151 E Carson St, Carson, CA 90745), and at the Dr. Martin Luther King, Jr. Public Library (17906 S Avalon Blvd, Carson, CA 90746). The report can also be accessed from the CSUDH website: <https://www.csudh.edu/fpcm/campus-master-plan-update/>

WHERE YOU COME IN

Your comments will be a part of the public record. If you wish to make a comment on the documents, you may submit your written comments until April 15, 2019. Your input is important for us to finalize the environmental document and potential mitigation measures. We encourage you to review and comment on the DEIR. You may send your comments to Jay W. Bond, University Planning Consultant 1000 E. Victoria Street, WH B470, Carson, CA 90747 or to the following e-mail address: masterplan2018@csudh.edu. If you have any questions, you may call (310) 243-3750. A **public meeting** will be held on March 7, 2019 between 6:30 p.m. and 8:00 p.m. at the Juanita Millender-McDonald Community Center, 801 E. Carson Street, Carson, CA to further explain the project and collect comments.

SPECIAL ACCOMMODATIONS

For individuals who require special accommodations (American Sign Language or other lingual interpreter, accessible seating, documentation in alternate formats, etc), contact (310) 243-3750. TDD users may contact the California Relay Service TDD line at 1-800-735-2929.

Appendix B. Air Quality

B.1 Air Quality Main Alternative Technical Memo

MEMO

TO: Jay Bond (CSU Dominguez Hills)
FROM: Stephanie Whitmore, Luke Yang (WSP)
SUBJECT: CSUDH Master Plan 2018 EIR – Air Quality and GHG Analysis (Increased Student Housing Alternative)
DATE: October 24, 2018

INTRODUCTION

This memorandum summarizes the methodology and results of the air quality and greenhouse gases (GHG) analyses conducted for one (1) proposed alternative for the California State University, Dominguez Hills (CSUDH or University) Master Plan 2018 EIR Project. Consistent with the analyses conducted for the proposed project, two scenarios were analyzed: 2025 Interim Year, and 2035 Buildout Year scenarios.

Increased Student Housing Alternative

The Increased Student Housing Alternative includes all of the same elements as the Proposed Project; however, the Increased Student Housing Alternative also would include 500 additional student beds, and the conversion of 180 market-rate apartment dwelling units to student housing units, which will accommodate 540 student beds. Under this alternative, the total number of student beds would increase by 1,040 over the Proposed Project, and the total number of market-rate dwelling units would reduce by 180. The location of the student housing, building size, and building footprint would remain identical with the market-rate apartment building proposed under the Project. The addition of more student housing under the Increased Student Housing Alternative would generate a greater amount of construction activity through both the interim and horizon years. The overall construction schedule is assumed to be same as the Proposed Project as the additional construction can be accommodated within the same period.

ANALYSIS METHODOLOGY

The Project's construction and long-term operational emissions were analyzed based on the South Coast Air Quality Management District (SCAQMD) guidelines. The construction emissions for the Increased Student Housing Alternative were calculated using the California Emissions Estimator Model (CalEEMod, Version 2016.2.2). CalEEMod calculates the short-term construction emissions from sources such as off-road equipment, on-road equipment, fugitive dust associated with grading, demolition, truck loading, and roads, and volatile emissions of reactive organic

gases (ROG) from architectural coating and paving. In comparison to the Proposed Project, this alternative would construct 500 additional student beds during the 2025 Interim Year and 540 additional student beds during the 2035 Buildout Year. This alternative would build 180 less market-rate dwelling units compared to the Proposed Project. All other key input assumptions for the construction emissions analysis were assumed to be identical to that of the Proposed Project.

The long-term operational emissions for the Increased Student Housing Alternative were calculated using CalEEMod. Analysis of the proposed alternative's operational impacts considers five emission source types: (1) mobile; (2) area; (3) energy; and (4) waste and (5) water. Mobile source emissions are generated by motor vehicle trips to and from the project site. Area source emissions are generated by, among other things, landscape and maintenance equipment, natural gas fireplaces, and the use of consumer products. Energy source emissions are generated as a result of activities in buildings for which natural gas is used (e.g., natural gas for heat or cooking). Waste and water source emissions are associated with the energy used for disposing waste, supplying and transmitting water, and treatment of wastewater.

Based on comparisons between the scope of this alternative and the Proposed Project, the following key inputs were assumed for the calculation of operational emissions for the 2025 Interim Year and 2035 Buildout Year scenarios:

2025 Interim Year

- Campus support facilities = 256,200 sq.ft.
- Total student beds = 500
- Business Park = 720,918 sq.ft.
- Retail = 96,085 sq.ft.
- Total market-rate dwelling units = 1,063
- No woodstoves and no fireplaces.
- CalEEMod default emission factors for consumer products.
- CalEEMod default emission factors for landscape equipment.

2035 Buildout Year

- Campus support facilities = 1,208,975 sq.ft.
- Total student beds = 2,028
- Business Park = 720,918 sq.ft.
- Retail = 96,085 sq.ft.
- Total market-rate dwelling units = 1,969
- No woodstoves and no fireplaces.
- CalEEMod default emission factors for consumer products.
- CalEEMod default emission factors for landscape equipment.

IMPACT CRITERIA

The Project-related impacts were defined using thresholds established by SCAQMD. The thresholds for both construction- and operation-related emissions are shown in Table 1 and Table 2.

Table 1
SCAQMD Short-Term Construction Thresholds

Criteria Pollutant	Pounds per Day/Metric Tons per Year
Reactive Organic Gases (ROG)	75 pounds/day
Oxides of Nitrogen (NO _x)	100 pounds/day
Carbon Monoxide (CO)	550 pounds/day
Respirable Particulate Matter (PM ₁₀)	150 pounds/day
Ultrafine Particulate Matter (PM _{2.5})	55 pounds/day

Source: South Coast Air Quality Management District

Table 2
SCAQMD Long Term Operational Thresholds

Criteria Pollutant	Pounds per Day/Metric Tons per Year
Reactive Organic Gases (ROG)	55 pounds/day
Oxides of Nitrogen (NO _x)	55 pounds/day
Carbon Monoxide (CO)	550 pounds/day
Sulfur Dioxide (SO ₂)	150 pounds/day
Respirable Particulate Matter (PM ₁₀)	150 pounds/day
Ultrafine Particulate Matter (PM _{2.5})	55 pounds/day

Source: South Coast Air Quality Management District

PROJECT IMPACTS

SHORT-TERM CONSTRUCTION

As noted, the Increased Student Housing Alternative would significantly increase the number of student beds on campus as compared to the Proposed Project, requiring additional construction activities.

The results indicate that the short-term construction impacts of the Increased Student Housing Alternative, based on the total of all emission sources, would have exceedances in both the 2025 Interim and 2035 Buildout Years for Reactive Organic Gases (ROG), while all other emissions would remain under SCAQMD thresholds. Table 3 summarizes short-term construction impacts for the Increased Student Housing Alternative.

Based on the analysis results, the number of significant impacts would remain identical between the Increased Student Housing Alternative and the Proposed Project. The Increased Student Housing Alternative would result in a slight increase of short-term construction emissions during 2025 Interim Year (as compared to the Proposed Project) from the construction of additional student housing. During 2025 Interim Year, the Increased Student Housing Alternative would increase ROG by 1.2 percent, Oxides of Nitrogen (NO_x) by 1.6 percent, Carbon Monoxide (CO) by 2.6 percent, Respirable Particulate Matter (PM₁₀) by two percent, and GHG emissions by 2.8 percent as compared to the Proposed Project. However, as noted, only ROG would exceed SCAQMD emission thresholds. The net differences between the Project and the Alternative are summarized and presented in Table 4.

During the second phase of the construction, between years 2026 and 2035, the construction of additional student housing is offset by the reduction in market-rate apartment units. During the 2035 Buildout Year, under the Increased Student Housing Alternative ROG would decrease by 1.9 percent, and PM₁₀ by 1.1 percent; CO would increase by 0.9 percent, and GHG emissions by 1.2 percent. The net differences between the Project and the Alternative are summarized and presented in Table 4. Similar to the 2025 Interim Year, only ROG would exceed SCAQMD emission thresholds in the horizon year.

The emissions calculation worksheets are included in Appendix A.

**Table 3

	2033	5	31	42	0	15	4	20,454
	2034	195	31	41	0	15	4	20,300
SCAQMD Threshold		75	100	550	150	150	55	-
Exceed Threshold?		Yes	No	No	No	No	No	N/A

Note: Because this is a program level project, construction schedule assumptions for emissions calculations were based on best estimation for implementing the project components and phasing. For 2025 Interim Year, construction schedule assumes components of University Village to be constructed between 2020 and 2024, and for the Campus Core, between 2023 and 2024. For 2035 Buildout Year, construction schedule assumes components of University Village to be constructed between 2026 and 2027, and for Campus Core between 2031 and 2034.

Exceed Threshold?		Yes	No	No	No	No	No	N/A

LONG-TERM OPERATIONAL

The Increased Student Housing Alternative, compared to the Proposed Project, would increase the number of student beds by 500 units during the 2025 Interim Year, and by 1,040 student beds during the 2035 Buildout Year. In addition, this alternative would also reduce the market-rate housing by 180 dwelling units during the 2035 Buildout Year. Because the Increased Student Housing Alternative would increase the number of student beds on campus, reducing student commuting trips, emissions related to commuting trips were considered as reduction as part of the proposed alternative. Based on these assumptions, the long-term operational emission values were calculated, and the results are presented in Table 5.

The results indicate that the long-term operation of the Increased Student Housing Alternative, based on total of all emission sources, would have exceedances in both the 2025 Interim and 2035 Buildout Years. In the 2025 Interim Year, the alternative would exceed SCAQMD thresholds for ROG, NO_x, and PM₁₀. In the 2035 Buildout Year, the alternative would exceed all SCAQMD emission thresholds, with the exception of CO and Sulfur Dioxide (SO₂).

As noted, the Increased Student Housing Alternative would significantly increase the number of student beds on campus as compared to the Proposed Project. The increased student housing would increase on-site emission levels due to higher energy demand, but this increase is offset by the emission reductions from the elimination of the commuting trips. This can be seen by comparing the emission levels between this alternative and the Proposed Project. Table 5 summarizes the comparison results. Based on the analysis results, the number of significant impacts would remain identical between the Increased Student Housing Alternative and the Proposed Project. However, the Increased Student Housing Alternative would result in lower

long-term operational emission levels of four criteria pollutants during 2025 Interim Year, and all the criteria pollutants during 2035 Buildout Year.

During 2025 Interim Year, the Increased Student Housing Alternative would reduce ROG by 24 percent, NO_x by nine percent, CO by 40 percent, and GHG emissions by one percent. This alternative would, however, increase SO₂, PM₁₀, and Ultrafine Particulate Matter (PM_{2.5}) slightly, by approximately one percent.

During 2035 Buildout Year, this alternative would reduce emissions of all criteria pollutants from one percent to as much as 148 percent.

The emissions calculation worksheets are included in Appendix A.

**Table 5
Comparison Between Proposed Project and Increased Student Housing Alternative (Project Long-Term Operational Emissions)**

	ROG (lbs/day)	NO_x lbs/day	CO lbs/day	SO₂ lbs/day	PM₁₀ lbs/day	PM_{2.5} lbs/day	GHG (CO₂e) metric tons/year

% Difference	-45%	-17%	-148%	-1%	-2%	-2%	-4%

CONCLUSION

Based on the analysis, the Increased Student Housing Alternative would have higher short-term construction criteria pollutant emissions as compared to the Proposed Project. However, the number of significant impacts would remain identical between the Increased Student Housing Alternative and the Proposed Project.

Despite the higher construction emissions, the Increased Student Housing Alternative would have a positive effect on the reduction of long-term operational emissions by the Project. Even though the number of significant impacts would remain identical between the Increased Student Housing Alternative and the Proposed Project, emissions of all criteria pollutants would be reduced from one percent to as much as 148 percent.

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	720.92	1000sqft	33.00	720,918.00	0
Apartments Mid Rise	1,063.00	Dwelling Unit	13.30	1,063,000.00	3040
Regional Shopping Center	96.09	1000sqft	2.20	96,085.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	31
Climate Zone	11			Operational Year	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
University/College (4Yr)	6,713.00	Student	11.80	1,639,960.00	0
Apartments Mid Rise	469.00	Dwelling Unit	6.30	469,000.00	1288
Day-Care Center	74.00	Student	1.00	17,970.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	31
Climate Zone	11			Operational Year	2035
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -
 Land Use - Master Plan
 Construction Phase - Adjusted.
 Grading - Master Plan
 Demolition - Master Plan
 Vehicle Trips - Master Plan
 Woodstoves - No woodstove and fireplace.

Campus Construction Summer 2025

CSUDH Campus Master Plan EIR - South Coast Air Basin, Summer

CSUDH Campus Master Plan EIR
South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Day-Care Center	110.00	Student	1.00	5,800.00	0
University/College (4Yr)	2,169.00	Student	11.80	1,862,200.00	0
Apartments Mid Rise	317.00	Dwelling Unit	4.20	317,000.00	800

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	31
Climate Zone	11			Operational Year	2025
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	702.44	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - .

Grading - Updated to reflect Luke's inputs

Vehicle Trips - Adjusted trip rates by Luke 9/13/18.

Landscape Equipment -

Mobile Land Use Mitigation -

Construction Phase - *

3.0 Construction Detail

Construction Phase

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days	Phase Description
1	Demolition	Demolition	1/20/2031	5/25/2031	5	90	
2	Site Preparation	Site Preparation	5/26/2031	9/26/2031	5	90	
3	Grading	Grading	9/29/2031	2/1/2032	5	90	
4	Building Construction	Building Construction	2/2/2032	5/21/2034	5	600	
5	Paving	Paving	5/22/2034	8/13/2034	5	60	
6	Architectural Coating	Architectural Coating	8/14/2034	12/31/2034	5	100	

Acres of Grading (Site Preparation Phase): 29.2

Acres of Grading (Grading Phase): 29.2

Acres of Paving: 0

Residential Indoor: 1,316,250; Residential Outdoor: 438,750; Non-Residential Indoor: 2,486,895; Non-Residential Outdoor: 828,965; Striped Parking Area: 0 (Architectural Coating – sqft)

OffRoad Equipment

CSUDH Campus Master Plan EIR - South Coast Air Basin, Summer

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Horse Power	Load Factor
Architectural Coating	Air Compressors	1	6.00	78	0.48
Demolition	Excavators	3	8.00	158	0.38
Demolition	Concrete/Industrial Saws	1	8.00	81	0.73
Grading	Excavators	2	8.00	158	0.38
Building Construction	Cranes	1	7.00	231	0.29
Building Construction	Forklifts	3	8.00	89	0.20
Building Construction	Generator Sets	1	8.00	84	0.74
Paving	Pavers	2	8.00	130	0.42
Paving	Rollers	2	8.00	80	0.38
Demolition	Rubber Tired Dozers	2	8.00	247	0.40
Grading	Rubber Tired Dozers	1	8.00	247	0.40
Building Construction	Tractors/Loaders/Backhoes	3	7.00	97	0.37
Grading	Graders	1	8.00	187	0.41
Grading	Tractors/Loaders/Backhoes	2	8.00	97	0.37
Paving	Paving Equipment	2	8.00	132	0.36
Site Preparation	Tractors/Loaders/Backhoes	4	8.00	97	0.37
Site Preparation	Rubber Tired Dozers	3	8.00	247	0.40
Grading	Scrapers	2	8.00	367	0.48
Building Construction	Welders	1	8.00	46	0.45

Trips and VMT

CSUDH Campus Master Plan EIR - South Coast Air Basin, Summer

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length	Worker Vehicle Class	Vendor Vehicle Class	Hauling Vehicle Class

	ROG	NOx	CO	SO2	Fugitive PM10	Exhaust PM10	PM10 Total	Fugitive PM2.5	Exhaust PM2.5	PM2.5 Total	Bio- CO2	NBio-CO2	Total CO2	CH4	N2O	CO2e
Percent Reduction	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

3.0 Construction Detail

Construction Phase

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days	Phase Description
1	Demolition	Demolition	1/1/2026	1/28/2026	5	20	
2	Site Preparation	Site Preparation	1/29/2026	2/11/2026	5	10	
3	Grading	Grading	2/12/2026	3/25/2026	5	30	
4	Building Construction	Building Construction	3/26/2026	5/19/2027	5	300	
5	Paving	Paving	5/20/2027	6/16/2027	5	20	
6	Architectural Coating	Architectural Coating	6/17/2027	9/8/2027	5	60	

Acres of Grading (Site Preparation Phase): 8.3

Acres of Grading (Grading Phase): 8.3

Acres of Paving: 0

Residential Indoor: 1,834,650; Residential Outdoor: 611,550; Non-Residential Indoor: 0; Non-Residential Outdoor: 0; Striped Parking Area: 0 (Architectural Coating – sqft)

OffRoad Equipment

CSUDH Campus Master Plan EIR - South Coast Air Basin, Summer

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Horse Power	Load Factor
Demolition	Concrete/Industrial Saws	1	8.00	81	0.73
Demolition	Excavators	3	8.00	158	0.38
Demolition	Rubber Tired Dozers	2	8.00	247	0.40
Site Preparation	Rubber Tired Dozers	3	8.00	247	0.40
Site Preparation	Tractors/Loaders/Backhoes	4	8.00	97	0.37
Grading	Excavators	1	8.00	158	0.38
Grading	Graders	1	8.00	187	0.41

B.3 Carbon Monoxide Analysis for Campus Master Plan

CARBON MONOXIDE ANALYSIS FOR CAMPUS MASTER PLAN 2018

INTRODUCTION

A microscale carbon monoxide (CO) analysis was performed to evaluate the potential impacts to ambient air quality associated with traffic changes due to the California State University, Dominguez Hills, Campus Master Plan 2018. CO concentrations were predicted for locations in the study area as described below. The analysis was performed based on the guidance provided by Caltrans' "Transportation Project-Level Carbon Monoxide Protocol" (Caltrans 1997) and EPA's "Guideline for Modeling Carbon Monoxide from Roadway Intersections" (USEPA 1992).

SCREENING

An intersection screening analysis was performed as described in the EPA Guidance. Thirty-seven intersections were evaluated based on changes in level of service (LOS) and overall intersection volumes for the No Project and Plus Master Plan Buildout (Plus Project) scenarios.

Of the thirty-seven intersections screened, twenty showed an LOS of E or F during one or more scenarios in the 2035 analysis year. Those twenty intersections were then ranked by volume, and the two intersections with the highest volume were identified. This process was repeated with the 2025 intersection data, and the same two intersections were identified.

Based on the screening analysis, two locations were selected for a detailed CO modeling analysis: Avalon Boulevard and Victoria Street, and West Artesia and Vermont Avenue. Tables of intersection volumes and LOS for each analysis year and scenario are included in Attachment 1.

MODELING METHODOLOGY

The CO microscale air quality analysis was conducted at the selected modeling sites, following Caltrans' "Transportation Project-Level Carbon Monoxide Protocol" (Caltrans 1997) and EPA's "Guideline for Modeling Carbon Monoxide from Roadway Intersections" (USEPA 1992).

Appendix B of the Caltrans Protocol recommends the use of the CALINE4 dispersion model as well as the latest version of the EMFAC mobile source emissions model. Details about model inputs and options are described in the following sections.

CALINE4 DISPERSION MODEL

Mobile source models are the basic analytical tools used to estimate CO concentrations expected under given traffic, roadway geometry, and meteorological conditions. The mathematical expressions and formulations that comprise the various models attempt to describe an extremely complex physical phenomenon as closely as possible. The dispersion modeling program used in this project for estimating pollutant concentrations near roadway intersections is the CALINE4 dispersion model.

CALINE4 is a line source air quality model based on the Gaussian diffusion equation and employs a mixing zone concept to characterize pollutant dispersion over a roadway. Gaussian models assume that the dispersion of pollutants downwind of a pollution source follows a normal distribution from the center of the pollution source. A complete description of the model is provided in CALINE4 – A Dispersion Model for Predicting Air Pollution Concentrations Near Roadways (Caltrans 1989).

The purpose of the model is to assess air quality impacts near transportation facilities. Given source strength, meteorology, and site geometry, CALINE4 can predict pollutant concentrations for receptors located within 500 meters of the roadway.

CALINE4 represents the roadway a series of straight line segments called links. Link coordinates for this analysis were developed using the methodology in the Caltrans Protocol. Approach and departure segments of an intersection accounted for the acceleration and deceleration that occurs within 150 meters of the traffic signal.

Concentrations are calculated for a series of receptors, representing locations where people may be exposed to vehicle exhaust. As recommended in the Caltrans Protocol, receptors were placed at a distance of 3 meters from the edge of the roadway, which is the closest distance for which modeled concentrations are considered valid, with a height of 1.8 meters. Receptors were spaced 25 m along the roadway, consistent with recommendations in the EPA guidance.

Figure 1 and Figure 2 provide a graphical representation of the links and receptors used to model each intersection.

Figure 1: Avalon and Victoria CALINE4 Model Geometry

Note: gray lines = CO sources (Roadways); yellow dots = receptors

Figure 2: Vermont and Artesia CALINE4 Model Geometry

Note: gray lines = CO sources (Roadways); yellow dots = receptors

Estimates of traffic volumes were obtained from the Transportation Impact Study (WSP 2017).

Dispersion models, such as CALINE4, are sensitive to meteorological input parameters. The meteorological input parameters for CALINE4 are wind speed, wind direction, standard deviation of the wind angle (i.e., sigma theta) and stability class. Dispersion models are also indirectly sensitive to temperature through the emission factors that are used to predict emission source strength. This analysis used a wind speed of 1 m/s, stability class “D”, and a temperature of 9.9 degrees Celsius. These conditions represent a worst-case winter day. The analysis utilized the CALINE4 option to search for the worst wind angle at each receptor to estimate the highest CO concentration at each receptor location.

1-hour average ambient CO concentrations were calculated to estimate the effect during peak-hour traffic conditions, and CO concentrations were estimated at a receptor height of 6 feet. The CO levels estimated by the model are the maximum concentrations which could be expected to occur at each air quality receptor site analyzed, given the assumed simultaneous occurrence of a number of worst-case conditions: peak-hour traffic conditions, conservative vehicular operating conditions, low wind speed, low atmospheric temperature, neutral atmospheric conditions, and maximizing wind direction.

EMFAC EMISSIONS MODEL

The recommended model to calculate emission factors in California is EMFAC. For this analysis, emission factors were calculated using the USEPA approved EMFAC2014 Web Database (Caltrans 2018). EMFAC was run for each analysis year (2025 and 2035) to provide emission factors by speed bin. Emission factors were calculated for the winter season because worst-case CO emissions occur during periods of colder ambient temperatures. The model was run with Los Angeles County defaults, which include vehicle mix, meteorological conditions, and applicable inspection and maintenance programs.

An emission factor was assigned to each modeled link according to the Caltrans Protocol. Emission factors for approach and departure links within 150 meters of the intersection, the Caltrans Protocol provides a methodology to estimate the average speed as a function of traffic volume, average cruise speed, and percentage of red time. Emission factors for external links were based on the average cruise speed.

PREDICTED CONCENTRATIONS

The CALINE4 model was run for each scenario to determine the maximum predicted 1-hour CO concentration at each receptor. The results are summarized in Table 2 and Table 3. The results include a background concentration of 6 ppm. The 8-hour concentrations were calculated by applying a persistence factor of 0.7 to the 1-hour model result, and adding a background concentration of 3.9 ppm. The background values represent the highest 1-hour and 8-hour CO concentration measured within the past 3 years at nearby ambient air monitor, as determined from South Coast Air Quality Management District’s annual Air Quality Data Tables (SCAQMD 2018).

All predicted concentrations are below the National Ambient Air Quality Standards (NAAQS). CO concentrations at Avalon and Victoria increase by a maximum of 0.1 ppm due to the project. CO concentrations at Vermont and Artesia do not increase as a result of the project. Based on these model results, the project is not expected to cause an exceedance of the NAAQS or exacerbate an existing exceedance of the NAAQS.

Attachments 2, 3, and 4 include EMFAC output files, CALINE4 input files, and CALINE4 output files, respectively.

TABLE 2: MAXIMUM MODELED CO CONCENTRATIONS AT AVALON AND VICTORIA (PPM)

Year – averaging period	No Project		Plus Project	
	AM	PM	AM	PM
2025 - 1 hour	6.3	6.3	6.3	6.4
2035 - 1 hour	6.2	6.3	6.3	6.3
2025 – 8 hour	4.1	4.1	4.1	4.2
2035 – 8 hour	4.0	4.1	4.1	4.1
1-hour CO NAAQS; 35 ppm				
8-hour CO NAAQS; 9 ppm				

TABLE 3: MAXIMUM MODELED CO CONCENTRATIONS AT VERMONT AND ARTESIA (PPM)

Year – averaging period	No Project		Plus Project	
	AM	PM	AM	PM
2025 - 1 hour	6.4	6.4	6.4	6.4
2035 - 1 hour	6.3	6.3	6.3	6.3
2025 – 8 hour	4.2	4.2	4.2	4.2
2035 – 8 hour	4.1	4.1	4.1	4.1

1-hour CO NAAQS; 35 ppm
8-hour CO NAAQS: 9 ppm

1. INTRODUCTION

This report presents an estimate of the potential health impact of the emissions of criteria pollutants that may result from the adoption and implementation of California State University Dominguez Hills (CSUDH)'s 2018 Campus Master Plan (the proposed Project). The proposed Project retains the existing campus enrollment cap of 20,000 full-time-equivalent students (FTES), while providing a framework for development of the University's campus in a forward-looking manner that accommodates growth from the current enrollment of approximately 11,000 FTES to the maximum enrollment of 20,000 FTES over a planning horizon extending to 2035.

As background, Environmental Impact Reports (EIRs) prepared pursuant to the California Environmental Quality Act (CEQA) have long evaluated project-related health impacts of toxic air contaminants, such as diesel particulate matter, through quantitative and/or qualitative means relative to air district-issued thresholds of significance. However, EIRs historically have not evaluated the specific health impacts of project-related increases in criteria pollutants,¹ other than to note and summarize scientific literature regarding the general effect of those pollutants on health. Instead, in accordance with air district-issued thresholds of significance and industry standard practice at the time, CEQA analysis historically and traditionally focused on estimating project-related mass emissions totals for criteria pollutants and, in certain cases, conducting dispersion modeling to assess impacts on local ambient air quality concentrations.

In response to comment on the proposed Project's Draft EIR, and in light of a cited decision issued by the California Supreme Court issued in December 2018, this analysis estimates the health impacts of criteria pollutants and their precursors, specifically those that are evaluated by the U.S. Environmental Protection Agency (USEPA) in rulemaking setting the national ambient air quality standards: oxides of nitrogen (NO_x), volatile organic compounds (VOC), carbon monoxide (CO), ozone (O₃), sulfur dioxide (SO₂), and particulate matter smaller than 2.5 microns in diameter² (PM_{2.5}). NO_x and VOCs are not criteria air pollutants but, in the presence of sunlight, they form O₃ and contribute to the formation of secondary PM_{2.5} and thus are analyzed here. As a conservative measure, SO₂ and CO are evaluated due to their small contribution to the formation of secondary PM_{2.5} and ozone. The health impacts from O₃ and PM_{2.5} are examined for this Project because the USEPA has determined that these criteria pollutants would have the greatest impact to human health. The emissions of other criteria pollutants, including VOC, NO_x and SO₂, are analyzed in their contribution in the formation of O₃ and secondary PM_{2.5}.

Notably, CEQA practitioners and other expert agencies (like air districts) are still developing tools and methodologies to provide the type of CEQA analysis described in the California Supreme Court's decision. In this report, Ramboll presents one method that can be used to correlate project-related mass emissions totals for criteria pollutants to estimated health-based consequences. More specifically, in order to estimate the health impacts of the increases of criteria pollutants for the

¹ Criteria pollutants are those pollutants with an air pollution standard or pollutants which are precursors to those with a standard. Pollutants with an air pollution standard include nitrogen dioxide, sulfur dioxide, ozone, carbon monoxide, particulate matter smaller than 2.5 microns and 10 microns and ozone. Precursor pollutants to criteria pollutants include oxides of nitrogen (NO_x), oxides of sulfur (SO_x), and volatile organic compounds (VOCs).

² USEPA's default health effect functions in BenMAP for PM use fine particulate (PM_{2.5}) as the causal PM agent, so the health effects of PM₁₀ are represented using PM_{2.5} as a surrogate.

proposed Project, Ramboll applied a photochemical grid model (PGM), Comprehensive Air Quality Model with extensions (CAMx),³ to estimate the small increases in concentrations of ozone and PM_{2.5} in the region as a result of the emissions of criteria and precursor pollutants from the Project. We then applied a USEPA-authored program, the Benefits Mapping and Analysis Program (BenMAP)⁴, to estimate the resulting health impacts from the small increases in concentration. Only the impacts of ozone and PM_{2.5} are estimated, as those are the pollutants that USEPA uses in BenMAP to estimate the impact of emissions of NO_x, VOCs, CO, SO₂, and PM_{2.5}. Ozone and PM_{2.5} have the most critical health impacts and thus are the emissions evaluated to determine the Project's health impacts.

³ Comprehensive Air Quality Model with Extensions.

2. TECHNICAL APPROACH

The first step in the process is to run the PGM with appropriate information to assess the small increases in ambient air concentrations that the Project emissions may cause. PGMs require a database of information, including the spatial allocation of emissions, in the area to be modeled. This includes both base (background/existing) emissions and Project emissions. The latest publicly available PGM database for Southern California, which contains base emissions, was developed by the South Coast Air Quality Management District (SCAQMD) in support of its adopted 2016 Air Quality Management Plan (AQMP)⁵ and was adapted for use in this analysis. This PGM database is tailored for Southern California (including Los Angeles County) using California-specific input tools (e.g., the Emission FACTors (EMFAC)⁶ mobile source emissions model) and uses a high-resolution 4-kilometer (km) horizontal grid to better simulate meteorology and air quality in the complex terrain and coastal environment of California.

Project emissions included NO_x, SO₂, CO, respirable (PM₁₀) and fine (PM_{2.5}) primary particulate matter (PM), and VOCs. As discussed above, NO_x and VOC are precursors to ozone and, along with SO₂, are also precursors to secondarily formed PM_{2.5}. CO also plays a smaller role in the formation of ozone and is thus conservatively evaluated here.

The USEPA's air quality modeling guidelines (Appendix W⁷) and ozone and PM_{2.5} modeling guidance⁸ recommend using a PGM to estimate ozone and secondary PM_{2.5} concentrations. The USEPA's modeling guidance does not recommend specific PGMs but provides procedures for determining an appropriate PGM on a case-by-case basis. Both the modeling guidelines and guidance note that the CAMx⁹ and the Community Multiscale Air Quality (CMAQ¹⁰) PGMs have been used extensively in the past and would be acceptable PGMs. As such, the USEPA has prepared a memorandum¹¹ documenting the suitability for using CAMx and CMAQ for ozone and secondary PM_{2.5} modeling of single-sources or group of sources.

To estimate the potential impacts of the proposed Project's emissions on ambient air concentrations, the Project's emissions were added to the CAMx 4-km annual PGM modeling database.¹² Operational and construction emissions from the Project were estimated as described in the Air Quality Section of the Draft EIR.¹³ For almost all pollutants, for any year, the maximum operational emissions at full buildout were greater than construction emissions. The exception is VOCs from architectural coatings during one year of construction. In order to estimate the worst-case impacts, the emissions from the highest year of construction VOCs were added to the full buildout emissions of all other pollutants. By

¹² SCAQMD performed WRF meteorological modeling for the CCOS 4-km domain and 2012 calendar year that has been processed by WRFCAMx to generate CAMx 2012 4-km meteorological inputs for the CCOS domain. The CMAQ 2012 emissions have been converted to the format used by CAMx using the CMAQ2CAMx processor.

¹³ To the extent that the Draft EIR used conservative inputs to estimate Project-related criteria pollutants and precursors, the analysis provided herein also is conservatively influenced by those inputs.

doing this, the results below present a worst-case analysis for the construction years and operational years.

For use in PGMs, each Project emissions source must be spatially distributed across the modeling grid cells so that they can be incorporated into the gridded emission inventory. The total unmitigated emission inventory for the Project was used in the analysis. This includes architectural coatings, VOCs in consumer products, natural gas combustion, landscaping, and emissions associated with motor vehicle use. The emissions from architectural coatings, consumer products, natural gas combustion, and landscaping are located onsite, and were therefore allocated to the grid cells representing the Project site (the University campus). The mobile source category includes both passenger vehicles and trucks. The mobile sources are also spatially distributed in both the site's grid cells, as well as the immediately adjacent grid cells. While it is expected that passenger vehicles and trucks may travel some distance outside of the Project site, they were conservatively distributed near the site's grid cells based on travel routes. Annual emission estimates from the Project were spatially gridded, temporally allocated, and chemically speciated to be used for photochemical grid modelling using the Sparse Matrix Operating Kernel Emissions (SMOKE) emissions modelling system supported by the USEPA. The emissions inventory, spatial allocation, and SMOKE inputs and outputs are shown in Appendix A.

As discussed above, the SCAQMD's Southern California 2016 AQMP modeling database was used for this Project. The Southern California 4-km CAMx modeling databases is based on a 2012 base meteorological year and includes future year emission scenarios. The 2023 future year projections were used for this analysis, as that is the nearest future year with base emissions available as of the date of this report. The Project's emissions were tagged for treatment by the source apportionment tools in CAMx to obtain the incremental ozone and PM_{2.5} concentration impacts due to the Project's emissions. More details and inputs for the PGM modeling are included in Appendix B.

Following completion of the CAMx source apportionment modeling, Ramboll used the USEPA's BenMAP^{14, 15} program to estimate the potential health impacts of the Project's contribution to ozone and PM_{2.5} concentration. BenMAP uses the concentration estimates produced by CAMx, along with population and health effect concentration-response (C-R) functions, to estimate various health effects of the concentration increases. BenMAP has a wide history of applications by the USEPA and others, including for local-scale analysis¹⁶ as needed for assessing the health impacts of a project's emissions. We used the USEPA default BenMAP health effects C-R functions that are typically used in national rulemaking, such as the health effects impact assessment¹⁷ for the 2012 PM_{2.5} National Ambient Air Quality Standard (NAAQS). The health effects that we used for PM_{2.5} include mortality (all causes), hospital admissions (respiratory, asthma, cardiovascular), emergency room visits (asthma), and acute myocardial infarction (non-fatal). For ozone, the endpoints are mortality, emergency room visits (respiratory) and hospital admissions (respiratory). Details on the BenMAP inputs and outputs and definitions for the health outcomes are shown in Appendix C.

3. RESULTS

This section presents the results of the health impact analysis for the incremental increases in PM_{2.5} and ozone resulting from primary and precursor emissions for these constituents¹⁸.

PM_{2.5}-related health outcomes attributed to Project-related increases in ambient air concentrations included asthma-related emergency room visits (4.38 incidences per year), asthma-related hospital admissions (0.38 incidences per year), all cardiovascular-related hospital admissions (not including myocardial infarctions) (1.05 incidences per year), all respiratory-related hospital admissions (2.44 incidences per year), mortality (10.31 incidences per year), and nonfatal acute myocardial infarction (less than 0.53 incidences per year for all age groups).

Ozone-related health outcomes attributed to Project-related increases in ambient air concentrations included respiratory-related hospital admissions (0.67 incidences per year), mortality (0.28 incidences per year), and asthma-related emergency room visits for any age range (lower than 3.38 incidences per year for all age groups).

For all these health endpoints, the number of estimated incidences is less than 0.0058% of the background health incidence. The “background health incidence” is the actual incidence of health effects as measured in the local population in the absence of additional emissions from the Project. When taken into context, the small increase in incidences and the very small percent of the number of background incidences indicate that these health impacts are negligible in a developed, urban environment. Because the health impacts from ozone and PM_{2.5} were negligible in light of background incidences, and health impacts from other criteria pollutants would be even smaller, the health impacts of those other criteria pollutants were not quantified.

UNCERTAINTY

Analyses that evaluate the increases in concentrations resulting from individual sources, and the health impacts of increases or decreases in pollutants as a result of regulation on a localized basis are routinely done. This analysis does not tie the increase in concentration to a specific health impact in an individual; however, it does use scientific correlations of certain types of health impacts from pollution to estimate increases in effects to the population at large.

There is a degree of uncertainty in these results from a combination of the uncertainty of the increase in concentration resulting from the PGM and the uncertainty of the application of the C-R increase. All simulations of physical processes, whether ambient air concentrations, or health impacts from air pollution, have a level of uncertainty associated with them, due to simplifying assumptions. The overall uncertainty is a combination of the uncertainty associated with each piece of the modeling study, in this case, the emissions model, the PGM, and BenMAP. While these results reflect a level of uncertainty, regulatory agencies, including the USEPA have judged that, even with the uncertainty in the results, the results provide sufficient information to the public to allow them to understand the health effects of increases or decreases in air pollution. In addition, the health impacts estimation using this method presumes that impacts seen at large concentration differences can be linearly scaled down to small increases in concentration. This

¹⁸ Health outcomes presented above also conservatively utilize maximum daily emissions, assumed to occur for an entire year. Should average daily emissions be used, results would be even lower. Specifically for mortality impacts from PM_{2.5} emissions, average daily emissions would be approximately 20% lower, and the corresponding mortality incidence rate would be similarly lower.

methodology of linearly scaling impacts is broadly accepted for use in regulatory evaluations and is considered as being health protective.¹⁹ These health impacts are conservatively estimated, and the actual impacts may be zero.

EMISSIONS INVENTORY, SPATIAL ALLOCATION, AND SMOKE SETUP

APPENDIX A

EMISSIONS INVENTORY, SPATIAL ALLOCATION, AND SMOKE SETUP
CALIFORNIA STATE UNIVERSITY – DOMINGUEZ HILLS
CARSON, CALIFORNIA

1. INTRODUCTION

As set forth in the Project's Draft Environmental Impact Report (EIR), construction and operational emissions from the Project were estimated using methodologies consistent with the California Emissions Estimator Model (CalEEMod®) and Project-specific data, where available. The model employs widely accepted calculation methodologies for emission estimates combined with appropriate default data if site-specific information is not available.

Annual emission estimates from CalEEMod® need to be spatially gridded, temporally allocated, and chemically speciated to be used for photochemical grid modeling. The Sparse Matrix Operating Kernel Emissions (SMOKE) emissions modeling system (Coats, 1996; Coats and Houyoux, 1996)¹ is used for this process.

Development of the gridded Project emissions is described in detail in Section 0.

2. PROJECT EMISSIONS AND SPATIAL ALLOCATION

Emissions were estimated for the Project to support the photochemical grid model (PGM) and are allocated into 4 kilometer (km) x 4 km grid cells. This section describes those emissions and how they were spatially allocated.

2.1 Project Emissions and Spatial Allocation

For use in PGMs, emissions must be spatially allocated over the area so that they can be incorporated into the gridded emission inventory. The total incremental emission inventory for the Project is below in Table 2-1. Mobile source emissions were split into categories based on the EMFAC2014 emission rates. For particulate matter, less than 2.5 microns in diameter (PM_{2.5}) emissions are used in the modelling; less than 10 microns in diameter (PM₁₀) emissions are presented for information below.

Table 2-1. Maximum Daily Criteria Air Pollutant Emissions Estimates						
Emission Category	ROG	NOx	PM ₁₀	PM _{2.5}	SO ₂	CO
	lbs/day	lbs/day	lbs/day	lbs/day	lbs/day	lbs/day

Operational	9.9	0.0	0.0	0.0	0.0	0.0
Construction (2024)	332	0.0	0.0	0.0	0.0	0.0
Abbreviations: CO - Carbon Monoxide lbs – Pounds NOx - Nitrogen Oxides PM _{2.5} - Particulate Matter less than 2.5 microns in diameter PM ₁₀ - Particulate Matter less than 10 microns in diameter ROG - Reactive Organic Gas SO ₂ - Sulfur Dioxide						

All emissions listed in Table 2-1 represent the maximum daily operational emissions estimated for the proposed Project's 2035 buildout scenario, aside from the construction architectural coatings emissions (labeled as such). This analysis utilizes the 2035 operational emissions as they constitute the highest maximum daily emissions for the Project, with the exception of 2024 Reactive Organic Gas (ROG) emissions from architectural coatings during construction. Those emissions were also included as a conservative approach, as they represent the highest maximum daily total Volatile Organic Compounds (VOC)² emissions for the Project. The analysis presented here conservatively assumes maximum daily emissions occur over an entire year. Should average daily emissions be used, corresponding results would be approximately 20% lower.

Mobile emissions include light, medium, and heavy-duty vehicles. Table 2-2 below provides a summary of the spatial distribution of mobile emissions broken down by major freeway. Values in this table were calculated based on estimated average vehicle miles traveled (VMT) during the operational phase of the Project. VMT were estimated based on peak hour traffic demands on various freeway routes located near the Project site, using data provided in the proposed Project's Transportation Impact Study³ (Appendix F of the Draft EIR).

Freeway	Distribution (%)
State Route 91	25.0%
Interstate 110	46.6%
Interstate 405	26.8%
Interstate 710	1.6%

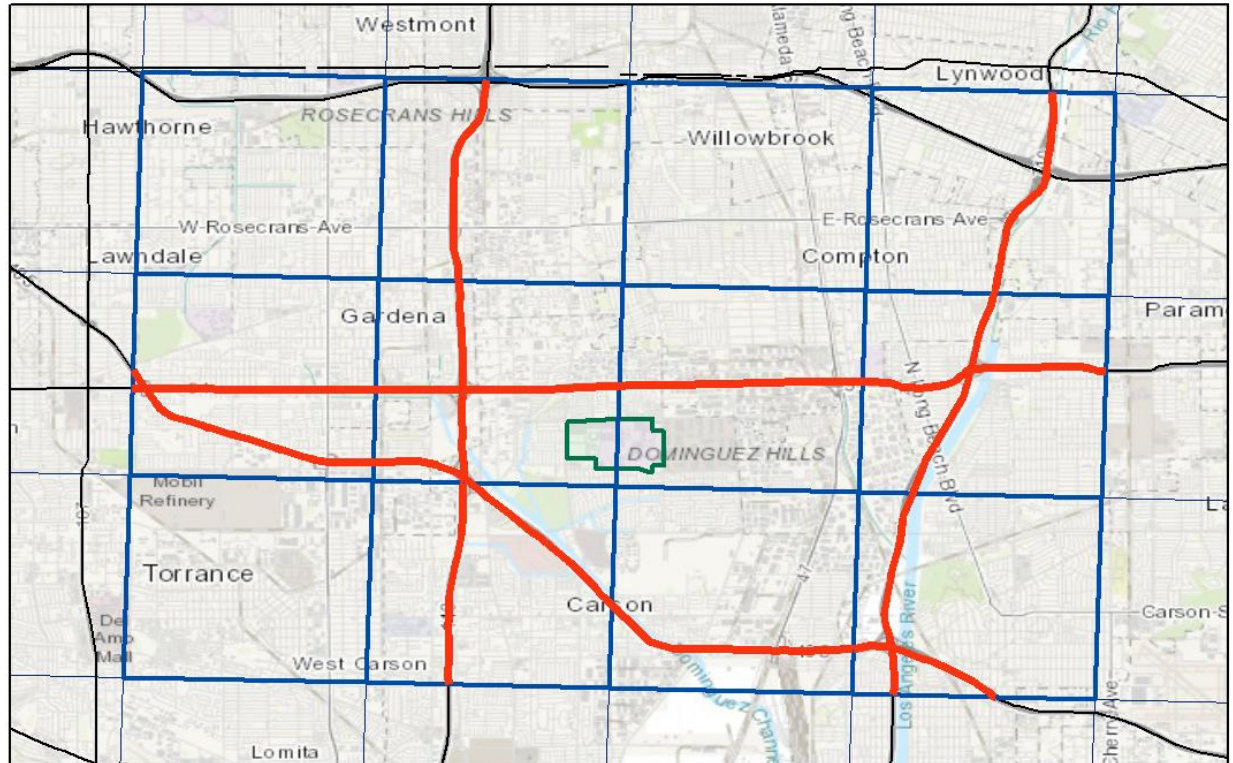

Project emissions are allocated evenly across the Project site into 4 km x 4 km grid cells for the PGM. Figure 2-1 below shows the Project boundary overlay with the 4-km grid. The Project site is shown in

² ROG means total organic gases minus ARB's "exempt" compounds (e.g., methane, ethane, CFCs, etc.). ROG is similar, but not identical, to USEPA's term "VOC", which is based on USEPA's exempt list, which is slightly different from ARB's list.

³ Appendix F of the Draft Environmental Impact Report for the 2018 Campus Master Plan. Available at: <https://www.csudh.edu/Assets/csudh-sites/fpcm/docs/campus-master-plan/csudh-cmp-deir-2019-appendices-updated.pdf>. Accessed: June 2019.

green, and the major roadways are shown in red. The 4x3 grid is presented on the figure with 12 blue grid cells. For major roadways that cross into multiple cells, emissions were allocated proportionally based on the length of roadway within each cell.

Figure 2-1. Overlap of Model Grid Cells on Project Site

2.2 Convert Project Inventories to SMOKE Input Format

The first step in the emissions processing was to convert the Project emission inventory into the Flat File 2010 (FF10) format for input to SMOKE. We assigned appropriate Source Classification Codes (SCCs) to the Project emissions sources. Table 2-3 provides the SCC assigned to each Project source.

Table 2-3. Assigned SCC to Project Emission Sources

Emission Source	SCC	SCC Description

2.2.1 Generate Spatial Surrogates for 4-km Domains

As part of the analysis, the Project source emissions need to be spatially allocated to appropriate geographic locations. The emissions can be allocated to modeling grid cells using gridding surrogates. To process the Project emissions, a Project area-based spatial surrogate was developed. The surrogate was developed using the US Environmental Protection Agency (USEPA's) Spatial Allocation Tool,⁵ which combines geographical information system (GIS)-based data (shapefiles) and modeling domain definitions to generate the appropriate gridded surrogate data set. The Project sources were then assigned specific surrogates for gridding by cross-referencing the SCCs. As mentioned above, all Project emissions were distributed in the modeling grid cells where the Project is located as shown in Figure 2-1. The mobile sources are spatially distributed in the site's grid cells and surrounding grid cells, as outlined in Table 2-2.

2.2.2 SMOKE 4 km Processing of Project Emissions

SMOKE system was used to process emissions for the Southern California 4-km modeling grid shown in Figure 2-1. A representative week from each month (seven days a month) was used to represent

⁵ https://www.cmascenter.org/sa-tools/documentation/4.2/html/srgtool/SurrogateToolUserGuide_4_2.pdf

the entire month's emissions. Holidays were modeled separately as if they were a Sunday. SMOKE was applied to perform following tasks:

1. Chemical Speciation: Emission estimates of criteria pollutants were speciated for the SAPRC07 AERO6 chemical mechanism employed in Community Multiscale Air Quality (CMAQ) in SMOKE processing. We used speciation profiles compatible with the SAPRC07 AERO6 mechanism from the SCAQMD's modeling system to be consistent with the regional modeling emissions. We then converted those emissions into Comprehensive Air Quality Model with extensions (CAMx)-ready formats using CMAQ2CAMx conversion program and species mapping.
2. Temporal Allocation: Annual emission estimates were resolved on an hourly timescale for CAMx modeling. These allocations were determined from the particular source category, specified by the SCC. Monthly, weekly, and diurnal profiles were cross-referenced to the SCCs to provide the appropriate temporal resolution. The temporal profiles were also obtained from the BAAQMD's emissions modeling system, as they were unavailable from South Coast Air Quality Management District (SCAQMD).
3. Spatial Allocation: The Project emission estimates were spatially resolved to the grid cells for modeling using spatial surrogates as described above.

2.2.3 QA/QC of Emissions Modeling

Standard quality assurance/quality control (QA/QC) was conducted during all aspects of the SMOKE emissions processing. These steps followed the approach recommended in the USEPA modeling guidance (USEPA, 2007). SMOKE includes quality assurance (QA) and reporting features to keep track of the adjustments at each processing stage and ensure that data integrity is not compromised. We carefully reviewed the SMOKE log files for error messages and ensured that appropriate source profiles were used. All error records reported during processing were reviewed and resolved. This is important to ensure that source categories are correctly characterized. We also compared SMOKE input and output emissions: Summary tables were generated to compare input inventory totals against model-ready output totals to confirm consistency. Spatial plots were generated to visually verify correct spatial allocation of the emissions.

2.2.4 Merge SMOKE Pre-merged Emissions to Generate CAMx-ready Emission Inputs

The final step in the emissions processing is to merge the Project gridded emissions with other regional components through the gridded merge program (MRGUAM) for CAMx. We merged the daily emissions in the time format required by CAMx.

2.2.5 Emissions Summary

Summaries of the Project gridded CAMx model-ready emissions data are provided in this section. Table 2-4 summarizes the Project emission inventory data input to SMOKE from the FF10 data files in pounds per day by source type. Table 2-5 presents the emissions data after SMOKE processing. The consistency in data in Tables 2-4 and 2-5 offer confidence in the correct operation of the SMOKE emissions processing for CAMx.

PGM INPUTS, OUTPUTS, AND ASSUMPTIONS
CALIFORNIA STATE UNIVERSITY – DOMINGUEZ HILLS
CARSON, CALIFORNIA

1. REGIONAL AIR QUALITY MODELING PLATFORM

The Southern California 2012 4-kilometer (km) Comprehensive Air Quality Model with extensions (CAMx) modeling database and a projected 2023 emissions database were used in this assessment. The 2012 base case is based on a Photochemical Grid Model (PGM) database developed by the South Coast Air Quality Management District (SCAQMD) as part of the modeling and attainment demonstration for their 2016 Air Quality Management Plan¹. This PGM database is tailored for Southern California and reflects updated emissions estimates, new technical information and enhanced air quality modeling techniques. The database uses a high-resolution 4-km horizontal grid to better simulate meteorology and air quality in the complex terrain and coastal environment of California. This contrasts with the United States Environmental Protection Agency's (USEPA's) national modeling platforms² used for national rulemakings (e.g., transport rules such as CSAPR³ or defining new National Ambient Air Quality Standards [NAAQS]) that use a coarser 12-km horizontal grid resolution.

Details of the model inputs, configuration, and results are presented in Section 2 of this Appendix.

2. REGIONAL GRID MODELING

In this section, we describe the regional PGM modeling setup to assess the impact of the Project emissions on the ambient Particulate Matter less than 2.5 microns in diameter ($PM_{2.5}$) levels in the region. The 2012 base case modeling databases were developed by the SCAQMD for the Community Multiscale Air Quality (CMAQ) PGM. The CMAQ annual 2012 4-km modeling database and annual 2012 4-km Weather Research and Forecasting (WRF) meteorological model output files were obtained from the SCAQMD. The SCAQMD CMAQ and WRF 2012 4-km data were then processed to generate a 2012 4-km annual PGM modeling database suitable for the CAMx. The following paragraphs describe how Ramboll developed the CAMx 2012 4-km annual database used in this study, starting with the SCAQMD CMAQ and WRF 2012 4-km data.

2.1 Model Inputs and Configuration

The SCAQMD emissions database has both 2012 and 2023 future year projections for CMAQ area and in-line point emissions. Ramboll converted both years' emissions to corresponding CAMx area and point-source emissions files using the CMAQ2CAMx interface program⁵. Sea salt emissions were developed using an emissions processor that integrates published sea spray flux algorithms to estimate sea salt PM emissions for input to CAMx. The CAMx sea salt emissions were then merged with area emissions files.

The most commonly used prognostic meteorological models to provide meteorological fields for air quality modeling are the WRF model (Skamarock et al., 2005) and the Fifth-Generation Mesoscale Model (MM5; Grell et al, 1994). MM5 is a nonhydrostatic, prognostic meteorological model developed in the 1970s by Pennsylvania State University and the National Center for Atmospheric Research (NCAR) and has been widely used for urban- and regional-scale photochemical, fine particulate, and regional haze regulatory modeling studies. However, development of MM5 ceased in 2006, and WRF has become the new standard model used in place of the older MM5 for regulatory air quality applications in the US. Developed jointly by NCAR and the National Center for Environmental Prediction in late 1990s, WRF has been under continuous development, improvement, testing and open peer-review for more than 10 years and used world-wide by hundreds of researchers and practitioners around the globe for a variety of mesoscale studies. SCAQMD adopted WRF version 3.6 for the 2012 simulations. For the current application, the meteorology remains unchanged for the future year simulation and SCAQMD WRF 2012 4-km model outputs were processed using the WRF-CAMx⁶ processor to generate the meteorological fields ready for CAMx. The WRF model employs a terrain-following coordinate system defined by pressure, using multiple layers that extend from the surface to 50 millibars (approximately 19 kilometers above ground level [AGL]). A layer averaging scheme is adopted for CAMx simulations to reduce the computational burden. Table 2-1 presents the mapping from the WRF vertical layer structure to the CAMx vertical layers.

⁵ <http://www.camx.com/download/support-software.aspx>.

⁶ WRF-CAMx is available on the CAMx website (<http://www.camx.com/download/support-software.aspx>).

The SCAQMD data set provided the lateral boundary conditions (BCs) for the 4-km state-wide modeling grid. The SCAQMD simulated a 12-km domain whose boundary concentrations were extracted from a global model simulation for the year 2012. The Model for Ozone and Related Chemical Tracers Version 4 (MOZART-4; Emmons et al., 2010) is a global chemical transport model

developed jointly by NCAR, the Geophysical Fluid Dynamics Laboratory, and the Max Planck Institute for Meteorology, and simulates chemistry and transport of tropospheric gases and bulk aerosols. The 12-km outputs were saved and used to derive the boundary conditions for the 4-km domain. The CMAQ2CAMX processor was used to convert the CMAQ 4-km boundary conditions to suitable CAMx BCs. The model was initialized from clean initial concentrations and five days of spin-up period were used for the 4-km grids to minimize their influence.

Additional data used in the air quality modeling include ozone column data from the Ozone Monitoring Instrument (OMI), which continues the Total Ozone Mapping Spectrometer (TOMS) record for total ozone and other atmospheric parameters related to ozone chemistry (OMI officially replaced the TOMS ozone column satellite data on January 1, 2006). OMI data are available every 24-hours and are obtained from the TOMS ftp site⁷. The CAMx O3MAP program reads the OMI ozone column txt file data and interpolates to fill gaps and generated gridded daily ozone column input data. The OMI data is used in the CAMx (TUV) radiation models, which is a radiative transfer model that develops clear-sky photolysis rate inputs for CAMx. The land use file was generated with the WRF-CAMx processor and modified to remove lakes and set coastal waters with a surf zone width of 50 m; this file was used to update the emissions database and provide more realistic representation of sea salt emissions.

Table 2-2 presents the CAMx configuration used for the modeling in this Project analysis. In the past, the Carbon-Bond IV (CB4) chemical mechanism (Gery et al., 1989) has been predominantly used for the California State Implementation Plan (SIP) modeling. In 1999, however, the California Air Resources Board's (CARB's) Reactivity Scientific Advisory Committee recommended switching to the 1999 State-wide Air Pollution Research Center (SAPRC99) chemical mechanism (Carter, 2000) based on a comprehensive review by Stockwell (1999), and SAPRC99 has since been the mechanism of choice for the California SIPs. The 2007 update to the SAPRC chemistry mechanism, called SAPRC07 (Carter, 2010), replaced the dated SAPRC99 mechanism. The version implemented in CAMx is SAPRC07TC, which includes additional model species to explicitly represent selected toxics and reactive organic compounds and uses numerical expressions of rate constants that are compatible with the current chemistry mechanism solver. The partitioning of inorganic aerosol constituents (sulfate, nitrate ammonium and chloride) between gas and aerosol phases is performed using the ISORROPIA module. The SOAP semi-volatile equilibrium scheme performs the organic aerosol-gas partitioning. These processes are described in more detailed in the CAMx user guide.

Table 2-2. CAMx Modeling Configuration		
Science Option	Configuration	Notes
Model Code	CAMx v6.5	Released June 2010
Horizontal Grid	4-km 1-way nesting	
O3 and PM 4-km	156 x 102 grid cells	
Vertical Grid	18 vertical layers extending up to ~19 km AGL	Collapsed from 30 WRF layers (see Table 3-1)
Initial Conditions	Clean initial conditions	5-day spin-up for 4-km domain
Boundary Conditions	CMAQ 4km lateral concentrations converted to CAMx	
Photolysis Rate	Photolysis rates lookup table	Derived from satellite measurements and TUV processor
Gas-phase Chemistry	SAPRC07TC	Solved by the Euler Backward Iterative (EBI) solver
Aerosol-phase Chemistry	ISORROPIA (inorganic aerosol) SOAP v2.1 (organic aerosol)	
Meteorological Input Preprocessor	WRFCAMx v4.7	
Advection	Piecewise Parabolic Method (PPM)	
Diffusion	Eddy diffusion algorithm	

2.2 Model Results

The future modeling scenario was simulated using the CAMx source apportionment technology. Both cumulative concentrations from all the sources and the concentrations from Project-specific emissions are derived from a single simulation following the previous section model configuration. The model results of hourly PM_{2.5} concentrations were processed into aggregated metrics that are relevant to health effects.

The metrics relevant to the PM_{2.5} health effects selected in this study are 24-hour annual average concentrations (see Appendix C). Figure 2-1 shows spatial plots of annual average and a single day episode maximum 24-hour average PM_{2.5} concentrations from the base case. In the base case, the Los Angeles County is the region most impacted along with the southern portion of Imperial County. Annual PM_{2.5} concentrations in these counties range between 10 and 20 micrograms per cubic meter (µg/m³) with isolated regions that could reach up to 25 µg/m³. Contributions of the Project emissions to annual average PM_{2.5} are about 0.16 µg/m³ at the most impacted areas and contributions to the maximum 24-hour average are as large as 0.42 µg/m³ at the most impacted areas. Figure 2-2 presents increases in annual average and maximum 24-hour average PM_{2.5} due to the Project by PM_{2.5}

component at the grid cell of maximum impact. It confirms that the PM_{2.5} increases due to the Project are mostly due to primary PM components.

Figure 2-1. Results of the 4 km PM_{2.5} Modeling Domain

PM_{2.5} Concentrations from the Base Case Scenario (left panels);
 Increases in PM_{2.5} due to the Project (center and right panels);
 Annual Averages (top panels);
 Maximum 24-hour Averages (bottom panels)

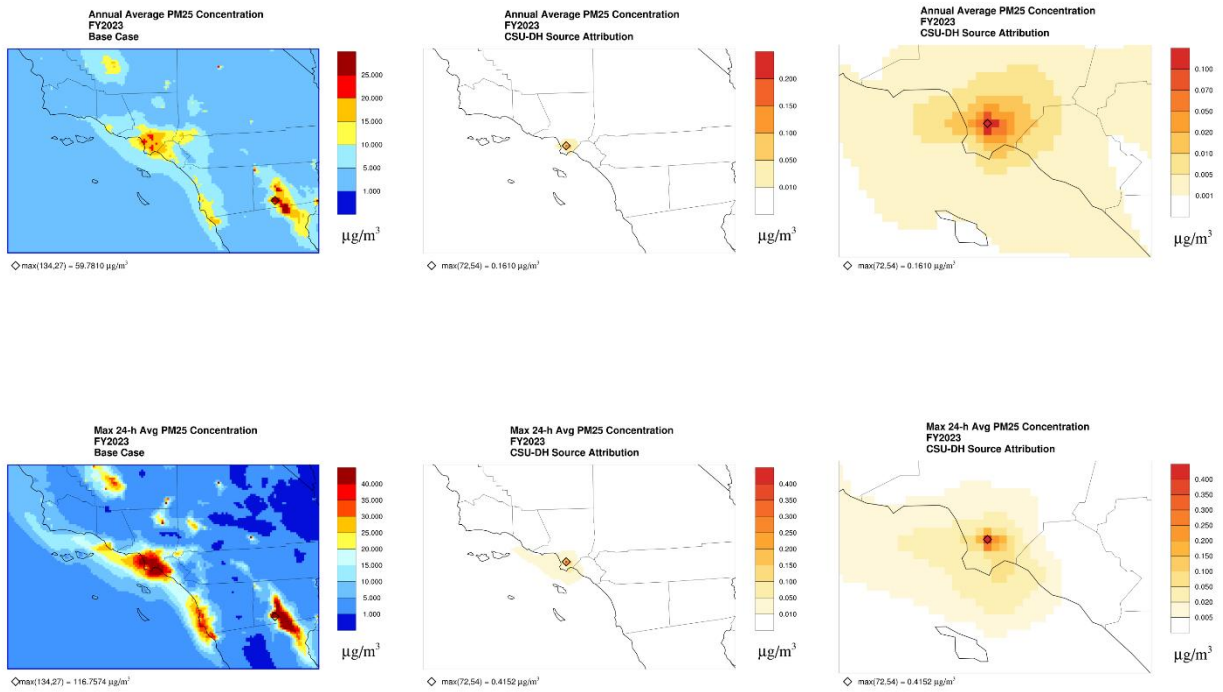

Figure 2-2. Increases in Annual Average and Episode Maximum 24-hour Average PM_{2.5} Concentrations due to the Project by PM_{2.5} Component: fine particulate sulfate (SO₄), nitrate (NO₃), ammonium (NH₄), primary organic aerosol (POA), elemental carbon (EC), and other primary PM (Other); Where the Maximum Impact of the Project's Emissions Occurred

The metrics relevant to the ozone health effects selected in this study are consistent with the ozone NAAQS (see Appendix C). The model provides hourly concentrations that are further post-processed to produce maximum daily average 8-hour (MDA8) ozone concentrations for each day. Figure 2-3 displays spatial plots of the annual highest MDA8 ozone for the 2023 emissions scenario and the increases in highest MDA8 ozone concentrations due to the Projects emissions. In the 2023 base case emissions scenario, the western Los Angeles, northern Orange, southern San Bernardino and eastern Riverside counties show the highest MDA8 ozone concentration between 90 and 100 ppb. The maximum increase in the highest MDA8 ozone concentrations due to the Project is 0.112 ppb in southern Los Angeles County.

Figure 2-4 displays MDA8 ozone for the base case and increases in MDA8 ozone due to the project on August 13, the day that the Project has the highest ozone contribution. The highest MDA8 ozone contribution due to the Project is 0.121 ppb (Figure 2-4, right) that occurs in southern Los Angeles County where total MDA8 ozone concentrations are 75 ppb.

Figure 2-3. Highest MDA8 Ozone Concentrations from the Base Case Scenario (left) and Increases in Highest MDA8 Ozone Concentrations due to the Project (right) for the Annual Modeling of the 2023 Emissions Scenario

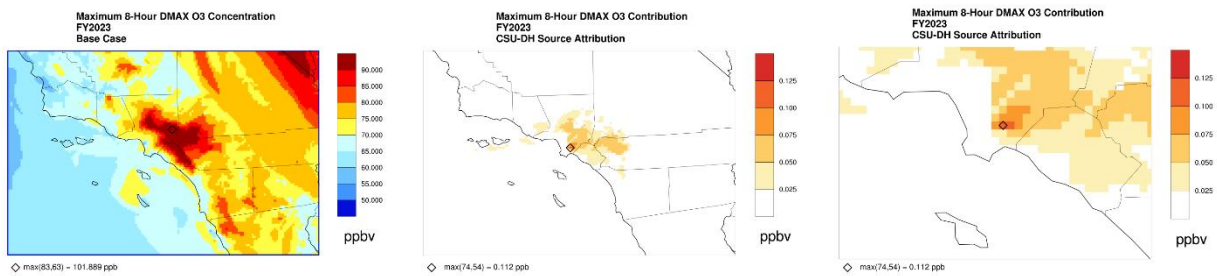

Figure 2-4. MDA8 Ozone Concentrations from the Base Case Scenario (left) and Increases in MDA8 Ozone Concentrations due to the Project (right) on August 13, the Day with the Highest Project Ozone Contributions for the Annual Modeling of the 2023 Emissions Scenario

APPENDIX C
BENMAP AND HEALTH OUTCOMES

APPENDIX C

BENMAP AND HEALTH OUTCOMES
CALIFORNIA STATE UNIVERSITY, DOMINGUEZ HILLS
CARSON, CALIFORNIA

1. HEALTH IMPACT ANALYSIS

The potential health effects of ozone and Particulate Matter less than 2.5 microns in diameter (PM_{2.5}) concentrations due to the Project's emissions were estimated using the Environmental Benefits Mapping and Analysis Program (BenMAP), Community Edition v1.4 (July 2018).¹ BenMAP, originally developed by the United States Environmental Protection Agency (USEPA), is a powerful and flexible tool that helps users estimate human health impacts and economic benefits resulted from changes in air quality. BenMAP outputs include PM- and ozone-related health endpoints such as premature mortality, hospital admissions, and emergency room visits. BenMAP uses the following formula to relate changes in ambient air pollution to certain health endpoints (AAI, 2018):

$$\text{Health Effect} = \text{Air Quality Change} \times \text{Health Effect Estimate} \times \text{Exposed Population} \times \text{Background Health Incidence}$$

- Air Quality Change - The difference between the starting air pollution level (the base) and the air pollution level after some change, such as a new source.
- Health Effect Estimate - An estimate of the percentage change in an adverse health effect due to a one unit change in ambient air pollution. Effect estimates, also referred to as concentration-response functions (CRFs), are obtained from epidemiological studies.
- Exposed Population - The number of people affected by the air quality change. The government census office is a good source for this information. This analysis uses data from PopGrid, which is an add-on program to BenMAP that allocates the block-level U.S. Census population to a user-defined grid.²
- Background Health Incidence - An estimate of the average number of people that die (or suffer from some adverse health effect) in a given population over a given period of time. For example, the health incidence rate might be the probability that a person will die in a given year. Health incidence rates and other health data are typically collected by the government as well as the World Health Organization.

The health endpoints analyzed in this study and the BenMAP results are presented in Section 2 of this appendix.

2. HEALTH IMPACT ANALYSIS

This section presents the health impact of the Project emissions on the population in the southern California domain, estimated by the BenMAP model. The Comprehensive Air Quality Model with extensions (CAMx) modeling results are processed to generate aggregated daily averages PM_{2.5} and maximum daily 8-hour ozone appropriate for various health endpoints. The CAMx simulation results from the full year (January to December) are used to estimate the health effects of PM_{2.5} and ozone. BenMAP translates increases in the pollutant concentration due to the Project emissions to changes in the incidence rate for each health effect using a CRF derived from previously published epidemiological studies. BenMAP often provides multiple CRFs based on different epidemiological studies for a given health endpoint. We used the USEPA default CRFs when evaluating health impacts. This analysis uses

¹ <http://www.epa.gov/air/benmap/>

² <https://www.epa.gov/benmap/benmap-community-edition>

population data from PopGrid, which allocates the census population to each modeled 4x4 kilometer (km) grid cell.

The population used for both the quantified health effects and the background health incidence presented here is future year 2035, for consistency with the Project buildout year.

2.1 PM_{2.5} Health Impact

Although there are a large number of potential health endpoints that could be included in the analysis as described above, we selected the key health endpoints that have been the focus of recent United States Environmental Protection Agency (USEPA) risk assessments (e.g., USEPA, 2010; USEPA, 2014). For example, the USEPA notes that health endpoints were selected based on consideration of at-risk populations (e.g. asthmatics), endpoints that have public health significance, and endpoints for which information is sufficient to support a quantitative concentration-response relationship (USEPA, 2014).

The health endpoints and associated CRFs examined in this study are presented in Table 2-1. Each CRF is based on a certain age range for the given health endpoint depending on the underlying epidemiological study on which it is based. Increases in the BenMAP-estimated health effect incidences and percent of background health incidence due to the Project emissions are presented in Table 2-2. These values reflect the total health impact in California across the Project domain.

Health Endpoint	Age Range	Daily Metric	Seasonal Metric	Annual Metric	CRF Selected
Emergency Room Visits, Asthma	0-99	24-hr mean			Mar et al., 2010 ¹
Mortality, All Cause	30-99	24-hr mean	Quarterly mean	Mean	Krewski et al., 2009 ¹
Hospital Admissions, Asthma	0-64	24-hr mean	-	-	Sheppard, 2003 ¹
Hospital Admissions, All Cardiovascular (less Myocardial Infarctions)	65-99	24-hr mean	-	-	Bell, 2012 ¹
Hospital Admissions, All Respiratory	65-99	24-hr mean	-	-	Zanobetti et al., 2009 ¹
Acute Myocardial Infarction, Nonfatal	18-24	24-hr mean	-	-	Zanobetti et al., 2009 ¹
Acute Myocardial Infarction, Nonfatal	25-44	24-hr mean	-	-	
Acute Myocardial Infarction, Nonfatal	45-54	24-hr mean	-	-	
Acute Myocardial Infarction, Nonfatal	55-64	24-hr mean	-	-	
Acute Myocardial Infarction, Nonfatal	65-99	24-hr mean	-	-	

¹ CRFs available in BenMAP (AAI, 2018)

The results show that the highest impact is for all-cause mortality, with an estimated mean increased incidence of 10.31 deaths per year due to the Project emissions. Smaller mean increased incidences per year were estimated for other relevant PM_{2.5}-related health outcomes: 4.38 increase in incidence of asthma related emergency room visits, 2.44 increase in incidence of respiratory hospital admissions, and 1.05 increase in incidence of cardiovascular hospital admissions.

It should be noted, however, that the estimated increased incidence in those health effects are quite minor compared to the background health incidence values (shown in Table 2-2 as percent of Background Health Incidence). For example, for mortality, the increase of 10.31 deaths per year due to Project emissions represents 0.0032% of the total all-cause mortality for people ages 30 to 99.

It is also important to note the uncertainty and conservative nature of the results presented, particularly for all-cause mortality. These estimates are based on a single epidemiological study that found an association between PM_{2.5} concentrations and mortality. While similar studies suggest that such an association exists, there remains uncertainty regarding a clear causal link. This uncertainty stems from the limitations of epidemiological studies, such as inadequate exposure estimates and the inability to control for many factors that could explain the association between PM_{2.5} and mortality such as lifestyle factors like smoking. In addition, the components of PM that may be associated with adverse health effects are yet unknown, but the analysis assumes that all PM is equally toxic, making it very conservative.

Health Endpoint ²	Incidences (Mean)	Percent of Background Health Incidence (%)
Emergency Room Visits, Asthma [0-99]	4.38	0.0033%
Mortality, All Cause [30-99]	10.31	0.0032%
Hospital Admissions, Asthma [0-64]	0.38	0.0021%
Hospital Admissions, All Cardiovascular (less Myocardial Infarctions) [65-99]	1.05	0.00047%
Hospital Admissions, All Respiratory [65-99]	2.44	0.0013%
Acute Myocardial Infarction, Nonfatal [18-24]	0.00044	0.0012%
Acute Myocardial Infarction, Nonfatal [25-44]	0.024	0.0013%
Acute Myocardial Infarction, Nonfatal [45-54]	0.068	0.0013%
Acute Myocardial Infarction, Nonfatal [55-64]	0.13	0.0014%
Acute Myocardial Infarction, Nonfatal [65-99]	0.53	0.0013%

¹ Health effects are shown terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences) values.

² Affected age ranges are shown in square brackets.

2.2 Ozone Health Impact

As noted above, although a larger number of health endpoints could be evaluated, we selected the health endpoints based on recent USEPA risk assessments (USEPA, 2010; USEPA, 2014). The health endpoints and associated CRFs examined in this study are presented in Table 2-3. Each CRF is associated with a certain age range for the given health endpoint depending on the epidemiological study on which it is based. Increases in the BenMAP-estimated health effect incidences and percent of

background health incidence due to the Project emissions are presented in Table 2-4. These values reflect the total health impact in California across the Project domain.

Table 2-3. Summary of Ozone Health Endpoints Used in this Study.

Health Endpoint	Age Range	Daily Metric	Seasonal Metric	Annual Metric	CRF Selected
Hospital Admissions, All Respiratory	65 - 99	MDA8	-	-	Katsouyanni et al., 2009 ¹
Mortality, Non-Accidental	0 - 99	MDA8	-	-	Smith et al., 2009 ¹
Emergency Room Visits, Asthma	0 - 17	MDA8	-	-	Mar and Koenig, 2009 ¹
Emergency Room Visits, Asthma	18 - 99	MDA8	-	-	Mar and Koenig, 2009 ¹

¹ CRFs available in BenMAP (AAI, 2018)

For this Project, asthma-related emergency room visits are associated with the highest health impacts due to the Project emissions in the southern California domain (3.38 incidences per year for adults ages 18 to 99 and 2.92 incidences per year for children ages 0 to 17). Hospital admissions due to respiratory issues for adults age 65-99 and non-accidental mortality have lower incidence increases (0.67 and 0.28 incidences per year, respectively).

It should be noted, however, that the estimated increases in those health effect incidences are quite minor compared to the background health incidence (shown in Table 2-4 as percent of Background Health Incidence). For example, the increase in asthma emergency room visits represents 0.0058% of the total asthma-related emergency room visits for children.

Table 2-4. BenMAP-Estimated Mean Ozone Health Effects of the Project Emissions Across the Southern California Domain¹

Health Endpoint ²	Incidences (Mean)	Percent of Background Health Incidence (%)
Hospital Admissions, All Respiratory [65-99]	0.67	0.00034%
Mortality, Non-Accidental [0-99]	0.28	0.00013%
Emergency Room Visits, Asthma [0-17]	2.92	0.0058%
Emergency Room Visits, Asthma [18-99]	3.38	0.0042%

¹ Health effects are shown terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences) values.

² Affected age ranges are shown in square brackets.

2.3 Conclusion

The PM_{2.5} and ozone concentration changes modeled by CAMx were converted to impacts on various health endpoints including premature mortality, hospitalizations, and emergency room visits, using the BenMAP health impact assessment model and USEPA defaults for health endpoints. Estimated changes in the health effect incidences are presented across the California grids in the southern California domain. For the PM_{2.5}-related health endpoints, the health impact on mortality is the highest

(Incidence = 10.31). For ozone-related health endpoints, asthma-related emergency room visits are most affected (Incidence = 3.38 for adults ages 18 to 99 and Incidence = 2.92 for children ages 0 to 17). Other health effect incidences are lower. Across the board, the estimated increases in those health effect incidences are quite minor compared to the background health incidence values with the largest PM_{2.5} health impact (all-cause mortality) representing only 0.0032% of the total of all deaths, and the largest impact for ozone (asthma related emergency room visits by adults) representing 0.0042% of all emergency room visits.

Health outcomes presented above conservatively utilize maximum daily emissions, assumed to occur for an entire year. Should average daily emissions be used, results would be even lower. Specifically for mortality impacts from PM_{2.5} emissions, average daily emissions would be approximately 20% lower, and the corresponding mortality incidence rate would be similarly lower. Overall, the estimated health impacts from the Project are low and represent only a very small fraction of the total background health incidence.

APPENDIX D
RESUMES OF TECHNICAL STAFF

SHARI BETH LIBICKI, PHD

Principal Air Quality Service Line Leader

Dr. Shari Beth Libicki, Ramboll Environ's global Air Quality Service Line Leader, has over 25 years of chemical fate and transport experience, as applied to managing greenhouse gas (GHG) emissions, odor evaluations, and estimating air emissions and dispersion from chemical processes, landfills and new developments. Her experience includes providing technical expertise to entitlement and litigation teams, negotiating complex technical agreements and permits with agencies and assisting facilities with compliance programs. She is an expert on GHG evaluations for California Environmental Quality Act (CEQA) documents, and is at the forefront of developing regulations in California, having served on the Regional Targets Advisory Council. She has conducted extensive air quality regulatory assessments for New Source Review/Prevention of Significant Deterioration (NSR/PRD) permitting and compliance auditing. Shari has lectured widely on evaluating climate change impacts for new developments and estimating chemical exposure for risk assessments. She currently serves as a Lecturer in the Department of Chemical Engineering at Stanford University.

EXPERIENCE HIGHLIGHTS

Land Use Entitlement

- Project director for online tool to display risks from rail and freeways for the SMAQMD. The tool is designed to provide a first tier analysis of traffic and rail risks for land use decision making.
- Project director for air quality and greenhouse gas analyses for a new marine terminal in Northern California. Critical evaluation issues included risks from diesel exhaust of maritime vessels and GHG emissions reductions from a "green cement" production plant.
- Prepared comprehensive air quality analysis for two large municipal solid waste landfills in Southern California. Evaluation included impact of exhaust from non-road heavy equipment, dust from waste operations, and emissions from landfill gas escaping the collection system, and flares and turbines used to destroy the landfill gas. Projects included public testimony on results of analysis.

- Analyzed the impacts of potential accident scenarios prior to the construction of several new industrial facilities. The results of the analyses were used to make recommendations as to how to improve the safety and minimize the risks to the surrounding community.
- Project director for the Chevron Renewal Project Revised Environmental Impact Report. The Revised EIR is intended to fulfill the requirements of a court decision with specific focus on the Climate Change and Air Quality sections of the EIR. The revision of the Climate Change section will describe mitigation measures and quantification of the efficacy of those mitigation measures. The Air Quality section will address a range of process alternatives in the refinery.
- Project director for the development of the California Air Pollution Control Officer's Association (CAPCOA) manual on quantifying mitigation for a wide variety of carbon reduction measures that can be used for residential and commercial development.
- Project director for CalEEMod®, a new software package to estimate GHG, air toxics and criteria pollutant emissions from new development projects in California.
- Evaluated climate change impacts of dozens of new projects under CEQA and National Environmental Policy Act (NEPA). Specific types of projects include large, multi-use developments, landfill expansions, and transportation hubs.
- Provided innovative air quality services for entitlement activities, including evaluating the impacts of freeways on air quality, the estimation of emissions from complex industrial facilities, and the impact on public health of those emissions. Provided testimony at public hearings in support of technical analyses.

Monitoring

- Conceptualized, designed and implemented a mobile application to characterize, locate, obtain meteorological data for, and time-stamp odor observations. The OdorApp allows the management of odor observations, and also allows easy display of odor observations in a manner that allows for analysis of odor complaints.
- Directed a yearlong ambient air-monitoring program to measure particulate matter and diesel particulate matter (DPM) at the boundary of a large landfill in Los Angeles and a nearby school. The results of the monitoring program were analyzed temporally and as a function of meteorology. The results of the program showed that nearby freeways provided an overwhelming fraction of the measured DPM.
- Designed a complex fourteen-station ambient air monitoring network around a co-disposal landfill to measure the concentrations of 19 toxic chemicals in both gaseous and particulate phase for risk assessment purposes and negotiated approval with local, state and federal regulators.
- Analyzed the results of a complex multi-year total suspended particulate monitoring program to understand the sources of arsenic in the ambient air, and to evaluate the health risks of the arsenic levels that could be related to nearby facility emissions.
- Designed and conducted the compliance ambient air monitoring program for a large hazardous waste facility. The ongoing program collects whole air and total suspended particulate samples at five stationary sites. Prepared risk assessment based on the program, and quarterly reports for review by the local air district and the California Environmental Protection Agency's (EPA)'s Department of Toxic Substances and Control (DTSC).
- Designed, negotiated and managed a novel cost-effective ambient air monitoring program that yielded real-time information on the health impacts of a site remediation. This study is the basis of a well-received paper.

Permitting and Enforcement

- Provided nationwide compliance assistance to six iron and steel mini-mills. Work conducted includes: preparation of Title V permit applications and supporting emissions estimates; preparation of PSD permits and associated emissions and dispersion modeling; evaluation of RACT controls for mini-mills.
- Managed PSD permit applications for two aluminum smelting facilities. This work included preparation of the emissions inventories, managing the Class I and Class II modeling effort, conducting the best available control technology (BACT) analysis, and preparing the technical document. She also negotiated permit conditions with the agencies, and assisted with cross-border discussions with other impacted agencies.
- Assisted a large landfill in Southern California respond to a series of Notices of Violation surrounding odor issues. Ramboll Environ conducted computational fluid dynamic (CFD) modeling study to evaluate the sources of odors at the landfill, as well as to predict where odors might occur in the neighborhood and under what conditions. Ramboll Environ also conducted a surrogate sampling study where it was found that ethanol was a surrogate for odors. Finally, Ramboll Environ assisted in the negotiations which allowed the landfill to continue operations.
- Managed the preparation of an application for an Authority to Construct for a state-of-the-art hazardous waste treatment storage and disposal facility, which included a risk assessment for the project, and successfully negotiated permit conditions with state and local agencies. Currently working with facility and regulators to implement permit conditions.
- Worked as a technical advisor to the Imperial County Air Pollution Control District (ICAPCD) for the permitting of a rail-haul landfill. This landfill is proposed to be the largest landfill in the United States, and had monitoring, modeling, and enforceability issues associated with the permit. Of particular interest was a phased permitting approach that allowed the landfill operator to take advantage of newer technologies that could reduce emissions of criteria pollutants over time.
- Prepared and submitted several Federal Operating Permit Applications under Title V of the Clean Air Act for industrial facilities. Currently working on ongoing negotiation for permits.

Other

- Evaluated the transport of perfluorooctanoic acid (PFOA) in the air and in the ocean as a part of a large multiphase study being carried out by DuPont. The study resulted in a poster presentation at the American Geophysical Union and centered on how the chemical properties of PFOA impact its transport.
- Provided support to a large shipping company in evaluating the effectiveness of its emissions reduction programs; oversaw design of an automated database system to track fuel use and emissions reductions from a variety of innovative programs to improve reporting and streamline the program.
- Conducted preliminary evaluation of whether patterns of measured lead in soil supported contention that lead resulted from airborne emissions from a lead emitting stack located at the site. Concluded that insufficient data was available for analysis.
- Designed a protocol for estimating the quantities of specific hazardous chemicals disposed of in California by region and waste type, and worked with the Department of Health Services to verify protocol.

Prior to joining Ramboll Environ, Shari held the following positions:

- Physical Sciences Officer, Bureau of Oceans and Environmental and Scientific Affairs, US Department of State
 - Developed and implemented a successful negotiation strategy for cooperative scientific projects with Japan and the Soviet Union.
 - Worked with Japan's Science and Technology Agency to initiate a Japanese funding organization for innovative international biotechnological studies.
- Staff Scientist, Alza Corporation

- Led teams that created, designed, tested, and patented controlled release transdermal and osmotic pump drug delivery systems.
- Studied the correlation between drug physical chemical data and dermal transport and absorption.
- Designed and implemented systems to provide effective membrane thickness control in the manufacture of miniature osmotic pumps.
- Lecturer, Department of Chemical Engineering, Stanford University
 - Taught courses in Chemical Engineering Laboratory and Technical Speaking and Writing.

RALPH E MORRIS

Managing Principal

Ralph Morris is the Managing Principal at Ramboll's North California, Utah and Colorado Offices, where he directs air quality modeling and analysis, emission inventory development, control strategy evaluation and regulatory air issues projects. With almost 40 years of air quality experience, Ralph is one of the original developers of many of the photochemical air quality models that are being or have been used for regulatory decision making in the United States and around the world, including co-developer of Ramboll's Comprehensive Air Quality Model with extensions (CAMx) as well as the UAM and UAM-V models.

In the late 1970s and 1980s, Ralph was one of the pioneers in modeling air pollution in Los Angeles using one of the first ever photochemical grid models (PGM), the Urban Airshed Model (UAM). The UAM was used to identify the optimal emissions control strategies for reducing ozone in Los Angeles targeting reducing ozone precursors that most efficiently reduce ozone and avoid reducing emissions from sources that would increase ozone. In the late 1980s, Ralph performed the EPA Five Cities UAM Study for the United States Environmental Protection Agency (USEPA) that demonstrated the use the UAM PGM for ozone air quality planning culminating in the delivery of the UAM to USEPA in 1990 as the USEPA-recommended ozone model. In the late 1980s and early 1990s, Ralph developed the next generation variable grid PGM (UAM-V) that treats urban city and regional transport issues within the same model and was used by the Ozone Transport Assessment Group (OTAG) to define the first regional control strategies designed to reduce the contributions of transport in the eastern U.S. (i.e., NO_x SIP Call). Ralph also led the development of ozone and PM_{2.5} State Implementation Plans (SIPs) for numerous cities to allow them to achieve clean air. After joining Ramboll Environ in 1994, Ralph was one of the leaders in the development of the Comprehensive Air-quality Model with extensions (CAMx) PGM that is being used today around the world for air quality planning, including for USEPA's transport rules. During the 1990s Ralph was involved in numerous ozone and PM_{2.5} SIP modeling studies and analyzed long-range transport of air pollutants.

In the 2000s, Ralph directed the development of an updated Pollutants in the ATmosphere for Hong Kong (PATH) air quality modeling system for the Hong Kong Environmental Protection Department (HKEPD) and applied it to southeast Asia to assess regional transport and urban ozone and particulate matter formation. During this time he directed the application of regional particulate matter (PM), ozone and visibility modeling using CMAQ and CAMx photochemical grid models for the southeastern (VISTA/ASIP), western (WRAP) and central (CENRAP) US Regional Planning Organizations (RPOs) for the development of the first round of regional haze State Implementation Plans (SIPs) that were due in 2007.

For the last decade Ralph has been leading regional air quality modeling for Alberta Environment and Park for a variety of issues including to assess the impacts of oil sands, development of modeling databases for various regions in Alberta and most recently to model the high winter PM_{2.5} occurrences in Edmonton and Red Deer. He led or is leading the application of the CMAQ and CAMx models to address numerous ozone and PM_{2.5} State implementation Plans (SIPs), as well as to address other air quality and air quality-related value (AQRV) issues associated with oil and gas development projects. Ralph has also addressed NO₂ and SO₂ issues including SIPs. Ralph was an original member of USEPA's ozone and fine particulate guidance workgroup and the CMAS Models-3/CMAQ External Advisory Committee (EAC).

EXPERIENCE

Over the last 39 years, Ralph has been involved in thousands of air quality studies. These studies include the development of clean air plans for cities and states so that they attain the health-based air quality standards and the evaluation of the air quality impacts of numerous types of sources. A few examples for some of Ralph's more recent projects are provided below.

- WRAP Regional Haze Photochemical Modeling. Ralph is currently leading the development of photochemical modeling databases for western states to be used in the next round of regional haze SIPs due July 2021. For the Western Regional Air Partnership (WRAP), Ralph has set up the CMAQ and CAMx models for the 2014 calendar year and conducted model performance evaluations.
- Denver 2020 and 2023 Ozone Attainment Demonstration Modeling. Ralph is currently leading the next round of Denver ozone attainment demonstration modeling. The CAMx and CMAQ models are being set-up for the 2016 summer ozone season and 2020 and 2023 future year attainment demonstration modeling is being conducted to address attainment of the 2008 and 2015 ozone NAAQS, respectively.
- Allegheny County Annual PM_{2.5} State Implementation Plan. Project Director for performing the air quality modeling to define emissions control strategy to demonstrate that Allegheny County

(Pittsburgh), Pennsylvania will attain the annual PM_{2.5} National Ambient Air Quality Standard (NAAQS). Performed 36/12/4/1.30.444 km WRF meteorological modeling for the 2011 year. SMOKE emissions modeling for 2011 and 2021. CAMx regional 36/12 km modeling to provided boundary conditions for mesoscale 4/1.33 km PM source apportionment modeling for 2011 base and 2021 future years. 2021 PM control strategy evaluation.

- Evaluation of USEPA’s 2011 National Air Toxics Assessment (NATA). Evaluated and assessed USEPA’s 2011 NATA modeling approach and results for modeling hundreds of air toxics compounds on a national scale. The 2011 NATA combined CMAQ national modeling results for reactive and non-reactive pollutants at 12 km grid cell resolution with AERMOD local-scale non-reactive modeling results by using the AERMOD results for receptors in the 12 km grid cell in a relative fashion to scale the CMAQ 12 km average concentrations. This unique method of model fusion of the CMAQ and AERMOD modeling results overcomes some of the issues associated with other techniques (e.g., CMAQ zero-out runs) when combining modeling results with disparate formulations.
- Dynamic Evaluation of Ozone Models for the South Coast (Los Angeles) Air Basin (SoCAB). Project Manager for conducting a dynamic evaluation of the CMAQ photochemical grid model in the SoCAB (Los Angeles, California region) using a 2008 and 2012 CMAQ modeling database. The dynamic evaluation compared the CMAQ modeled ozone trends over a long time period (1990-2015) with the observed ozone trends and found the CMAQ model underestimated the observed rate of ozone reductions over time. Potential reasons for this included the likely underestimation of VOC or overestimation of NO_x emissions in the region.
- Denver 2017 Ozone SIP Modeling. For over a decade, Ralph has led the Denver ozone SIP modeling for the 2003, 2008 and now the 2017 Denver ozone SIPs. For the Denver 2017 ozone SIP modeling we developed 2011 CAMx PGM modeling database using WRF meteorological and SMOKE emissions modeling. This included high-resolution mobile source emissions for the Denver region using link-based activity data from a Transportation Demand Model (TDM) and mobile source emission factors from MOVES2014. Conducted CAMx 2011 base case modeling and model performance evaluation. Projected emission to 2007 and 2023 and conducted emission reduction control strategy modeling to demonstrate attainment of the ozone standard.
- Allegheny County 1-Hour SO₂ State Implementation Plan. Project Manager for performing the air quality modeling to define emissions control strategy to demonstrate that Allegheny County (Pittsburgh), Pennsylvania will attain the 1-hour SO₂ National Ambient Air Quality Standard (NAAQS). Perform 36/12/4/1.3 km WRF meteorological modeling for multiple years. Conduct model shoot-out using multiple models (e.g., AERMOD, CALPUFF and SCICHEM) and model configurations to determine best performing model for simulating SO₂ and use model to demonstrate attainment of the SO₂ NAAQS.
- BLM Environmental Impact Statement and Resource Management Plan for Oklahoma, Texas and Kansas. Project Manager for preparing the air quality and climate change sections of the Environmental Impact Statement (EIS)/ Resource Management Plan (RMP) for the U.S. Bureau of Land Management (BLM) and Bureau of Indian Affairs (BIA) to guide the management of BLM- and BIA-administered lands in the states of Oklahoma, Texas and Kansas
- Navajo Generating Station Environmental Impact Statement. Project Manager for coordinating the Environmental Impact Statement (EIS) required under the National Environmental Policy Act (NEPA) for the Navajo Generating Station coal-fired power plant and Kayenta Coal Mine Complex in Arizona. Technical services include air quality modeling and analysis of air monitoring data for criteria and hazardous air pollutants, assessments of human health risk and ecological risk due to atmospheric deposition from the emission sources, and preparation of Technical Support Documents for the EIS.
- Western Air Quality Study (WAQS). Project Manager for WRF meteorological, SMOKE emissions and CMAQ/CAMx air quality modeling of the western U.S. to develop the next generation air quality modeling databases to address ozone, PM_{2.5}, visibility and deposition issues in the western U.S.. Develop new 2008, 2011 and 2014 regional modeling platforms and distribute using the Intermountain West Data Warehouse (IWDW). Assess the role of regional transport on ozone, PM and visibility issues in western U.S. states.
- Air Quality Impacts of Off-Shore Oil and Gas Production. Ralph is currently leading two studies for BOEM to estimate the on-shore air quality impacts due to off-shore oil and gas development in the

Arctic Sea near Alaska and the Gulf of Mexico. This multi-year multi-million dollar study will project future year emissions and air quality impacts and develop emission exception screening thresholds.

- Air Quality Impacts of Fires. Project Manager of studies to assess the contributions of wildfires, prescribed burns and agricultural burning to ozone and PM air quality throughout the USA. Develop fire emission inventories and use the CAMx photochemical grid model source apportionment tool to calculate the contributions of fires to ozone and PM air quality. Results are used to identify exceptional events and assist planners in fire management practices.
- BLM Montana/Dakotas Photochemical Grid Model Modeling Study. Project Manager for the BLM Montana/Dakotas PGM modeling study to assess the air quality and AQRV impacts due to oil and gas development. The Bakken Shale formation in the Montana/Dakotas region is the most rapidly growing oil and gas development area in the U.S. Under this study, Ramboll is developing a comprehensive oil and gas emissions inventory and performing base year 2012/2013 and future year 2032 modeling using the CAMx photochemical grid model.
- Allegheny County PM_{2.5} SIP Modeling. The PM_{2.5} problem in Allegheny County (Pittsburgh), Pennsylvania is due to a combination of regional transport from upwind states and local sources within a river valley complex terrain environment. Ralph Morris led the Allegheny County PM_{2.5} SIP modeling effort that used the CAMx photochemical grid model with a 36 km CONUS, 12 km Midwest, 4 km southeastern Pennsylvania and 0.8 km Allegheny County grid nests to demonstrate the area would achieve the 24-hour PM_{2.5} standard by 2010. CAMx was run on the 36/12/4/0.8 km grids using two-way grid nesting. Local sources were treated using the CAMx subgrid-scale Plume-in-Grid treatment.
- Development of Air Quality Modeling System for Hong Kong. Ralph was Project Manager and led the development of a new air quality modeling system for Hong Kong. The WRF/MM5 meteorological, SMOKE/CONCEPT emissions and CMAQ/CAMx air quality models were set up for a 27/9/3/1 km modeling domain with the 36 km domain covering Asia and the 1 km domain focused on Hong Kong. The modeling system was delivered to the HKEPD as a turn-key system.
- St. Louis Ozone and PM_{2.5} SIP. Ralph led the air quality modeling efforts for the development of clean air plans for St. Louis, Missouri that were included in the St. Louis ozone and PM_{2.5} State Implementation Plans (SIPs). He worked with the states of Missouri and Illinois to identify the optimal control plan for the region and performed air quality modeling to demonstrate that St. Louis would achieve the ozone and PM_{2.5} standards.
- Air Quality Assessments in Alberta, Canada. For almost a decade, Ralph Morris has been leading air quality studies for Alberta Environment to address Canada wide standards and Province air quality goals and objectives. These activities have included developing emission inventories for the Alberta oil sands region and urban areas, conducting meteorological modeling and performing air quality modeling using the CMAQ model to address ozone, PM_{2.5}, SO₂, NO₂, exposure and deposition issues in the Province.
- Expert Testimony for Air Quality Related Issues. Because of Ralph's vast expertise in air quality issues and in particular air quality modeling, over the last two decades he has served as an expert witness in numerous litigation cases.
 - Ameren Rush Island: Ralph was an expert witness and testified at trial in St. Louis April 2019 in a case where the Rush Island coal-fired power plant was accused of causing health effect impacts due to alleged illegal emissions since it failed to obtain a PSD permit and install BACT.
 - LG&E Cane Run Class Action Suit: Starting in 2015, Mr. Morris is serving as an expert witness led by Hunton and Williams in a case involving nuisance dust deposition from the Louisville Gas and Electric Cane Run coal-fired EGU.
 - Minnesota Power Plant Damage Assessment: During 2015, Ralph performed air quality modeling of the potential damages and costs associated with fossil-fueled power generation in Minnesota and prepared testimony.
 - Mead Westvaco Luke Mill: Expert witness and testify at trial in a case where a Maryland paper mill was accused of violating the Clean Air Act (CAA) and emitting illegal emissions (2012-2016).

- DTE Energy Monroe: In 2010-2011 Ralph was retained as an expert witness by Hunton and Williams and prepared expert report and attended trial in Detroit for the USDOJ NOV case against then Monroe coal-fired power plant in the Detroit, Michigan region.
- AEP NOV: Ralph was an expert witness for American Electric Power (AEP) from 2003-2006 through Sidley Austin in the US DOJ NOV charges against 9 coal-fired power plants in the Midwestern US.
- Illinois Power/Dynegy Baldwin NOV: Ralph was an expert witness for Illinois Power through Akin Gump in the US DOJ Notice of Violation case against the Baldwin Power Plant in Illinois. Ralph prepared expert reports and was deposed on the ozone and PM impacts of the alleged excess emissions including a review and critique of the plaintiffs CALPUFF modeling that found errors and omissions.
- First Energy Samsis: Expert witness for the Samsis coal fired power plant in Ohio NOV case.
- Louisiana Generating Big Cajun 2: Ralph was an expert witness for a USDOJ NOV case against the Big Cajun 2 coal-fired power plant in Baton Rouge, Louisiana during 2012.
- WE Energies Power the Future: In 2004, Ralph performed air quality modeling using CAMx and testified in front of a judge in Madison, WI on the Wisconsin Electric's plans to retire an old and build a new coal fired power plant at the Oak Creek facility. Testimony also included a critical review of CALPUFF modeling performed by the opponents.
- Minnesota Acid Rain Legislation: In the early 1980s Ralph performed modeling and testified in Minneapolis, MN in front of a judge for Northern States Power regarding the impacts of local sources in Minnesota on acid deposition in Minnesota.
- Oil and Gas Environmental Impact Statements. Ralph has led the air quality modeling component of several oil and gas Environmental Impact Statements to assess the air quality, visibility and deposition impact of oil and gas development in Colorado, Utah, Wyoming and New Mexico
- Air Quality Permitting Studies. As part of the permitting process, Ralph has conducted numerous air quality modeling studies to demonstrate that new sources would be compliant with air quality standard and thresholds of concern. Sources evaluated include coal and natural gas powered electricity generation; cement plants and oil and gas production, distribution and refining.
- Air Quality Impacts of Mobile Sources. Ralph has performed numerous studies to assess the air quality impacts of alternative engine technologies and fuels. In the 1980s he modeled the air quality impacts of alternative fuels in five cities for the USEPA. In the 1990s he led the air quality modeling component of the \$20M Auto/Oil Program for the automobile manufacturers and oil companies. He also led the assessment of the air quality impacts of hybrid vehicles for a joint study by General Motors and Toyota. More recently he evaluated air quality impacts of passenger vehicles for Toyota and the air quality impacts in California due to the use of biodiesel in on-road and non-road diesel engines.
- Technical Assistance to USEPA. For over three decades, Ralph has provided technical assistance to the USEPA to assist them in implementing their air program and developing the USEPA air quality modeling guidelines. This assistance included demonstrating how photochemical grid models (PGMs) can be used in ozone air quality planning and delivering the UAM PGM to USEPA in 1990 as a turn-key PGM ozone modeling system. In 2012 Ralph evaluated six long range transport (LRT) models using atmospheric field study tracer tests, evaluated chemical dispersion models using aircraft data and demonstrated how a PGM can be used for single-source modeling that helped EPA formulate their new July 2015 air quality modeling guidelines. More recently he is assisting USEPA to update the chemical mechanisms in the CAMx and CMAQ models and implement improved aqueous-chemistry and secondary organic aerosol modules.
- Various Clients. Prior to joining ENVIRON, Ralph worked for over 15 years at Systems Applications International (SAI) in San Rafael (now part of ICF Consulting), California, where he was Director of the Advanced Modeling Program, managed model development activities and air quality modeling and analysis studies. His work at SAI included the development and application of the RPM, UAM, UAM-V and REMSAD modeling systems.
