ApproachDel:	25.8	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.5]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=70]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=1920]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	1475.1	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=176.2]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=430]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2810]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R

Peak Hour Delay Signal Warrant Report

Intersection #5 Central Ave. & Charles Willard St.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 1 0 1 0	1 0 1 1 0	0 0 1! 0 0	0 1 0 0 1
Initial Vol:	20 720 10	40 890 20	10 10 40	20 10 70
ApproachDel:	xxxxxx	xxxxxx	33.2	27.0

Approach[eastbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.6]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=60]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=1860]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

Approach[westbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.7]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=100]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=1860]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	60 0 10	0 0 0	0 1060 610	50 900 0
ApproachDel:	94.3	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=1.8]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=70]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2690]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #6 Central Ave. & Project Driveway/Beachey Pl.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 1 0 1 0	1 0 1 1 0	0 0 1 0 0	0 1 0 0 1
Initial Vol:	40 800 70	80 1010 180	20 0 10	20 0 30
ApproachDel:	xxxxxx	xxxxxx	96.6	41.1

Approach[eastbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.8]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=30]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=2260]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

Approach[westbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.6]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=50]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=2260]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #6 Central Ave. & Project Driveway/Beachey Pl.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 1 0 1 0	1 0 1 1 0	0 0 1 0 0	0 1 0 0 1
Initial Vol:	40 800 70	80 1010 180	20 0 10	20 0 30
Major Street Volume:	2180			
Minor Approach Volume:	50			

Minor Approach Volume Threshold: 39 [less than minimum of 150]

SIGNAL WARRANT DISCLAIMER

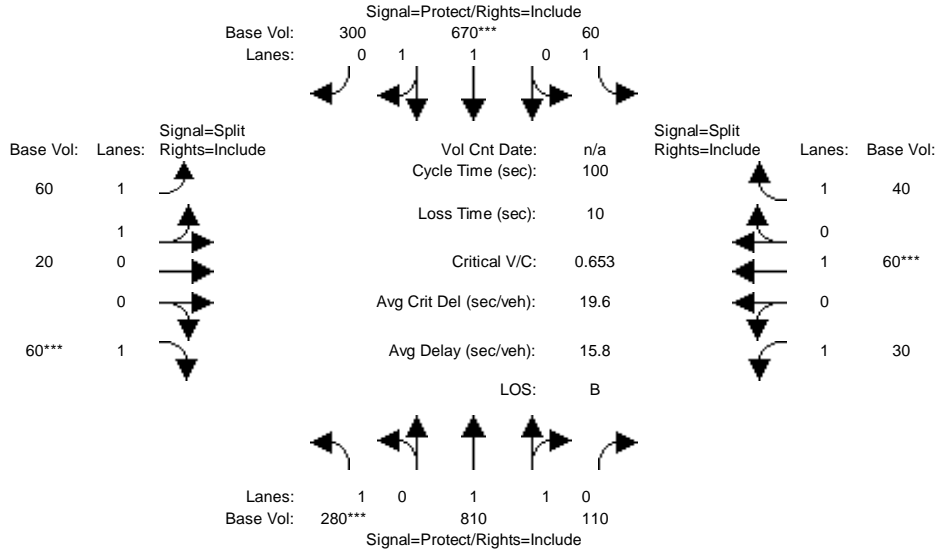

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	4610.0	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=576.3]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=450]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=3630]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R

Approach[northbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.1]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=20]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2510]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #9 University Dr. & Toro Center Dr.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	0 0 0 0 0	1 0 0 0 1	1 0 2 0 0	0 0 1 1 0
Initial Vol:	0 0 0 0	60 0 270	170 450 0	0 520 30
ApproachDel:	xxxxxx	16.7	xxxxxx	xxxxxx

Approach[southbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=1.5]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=330]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=1500]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #9 University Dr. & Toro Center Dr.

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R

ApproachDel:	87.2	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=1.7]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=70]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2640]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

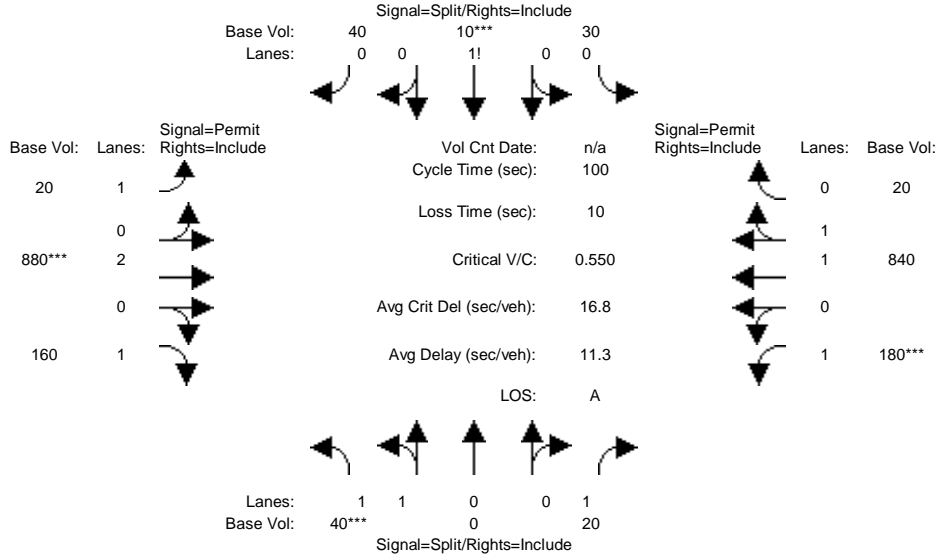

The peak hour warrant analysis in this report is not intended to replace

a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #3: [approach count=4][total volume=2620]
SUCCEED - Total volume greater than or equal to 800 for intersection
with four or more approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx			14.1			xxxxxx			xxxxxx		

-----|-----|-----|-----|

Approach[southbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.8]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=210]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=1390]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	1	0	0	0	0	0	0	0	2	1	0	2
Initial Vol:	400	0	50	0	0	0	0	1520	220	20	1390	0
ApproachDel:	4453.9			xxxxxx			xxxxxx			xxxxxx		

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=556.7]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=450]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=3600]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	1	0	0	0	0	0	0	0	2	1	0	2
Initial Vol:	400	0	50	0	0	0	0	1520	220	20	1390	0

Major Street Volume: 3150

Minor Approach Volume: 450

Minor Approach Volume Threshold: -119 [less than minimum of 150]

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

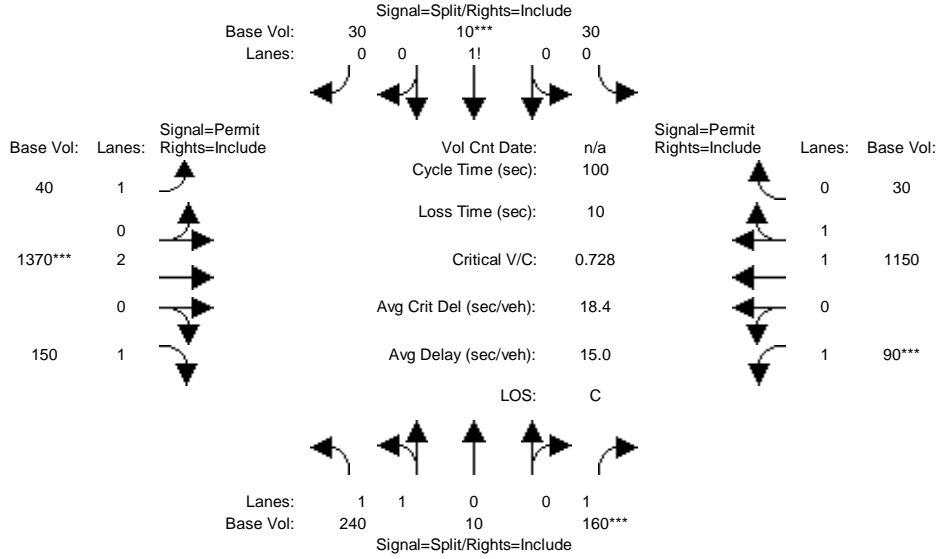

The peak hour warrant analysis in this report is not intended to replace

a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #4 Victoria St. & Project Service Rd.

Base Volume Alternative: Peak Hour Warrant NOT Met

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Movement, Control, Lanes, Initial Vol, and ApproachDel.

Approach[northbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.1]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=20]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2510]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future.

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #4 Victoria St. & Project Service Rd.

Base Volume Alternative: Peak Hour Warrant NOT Met

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Movement, Control, Lanes, Initial Vol.

with four or more approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

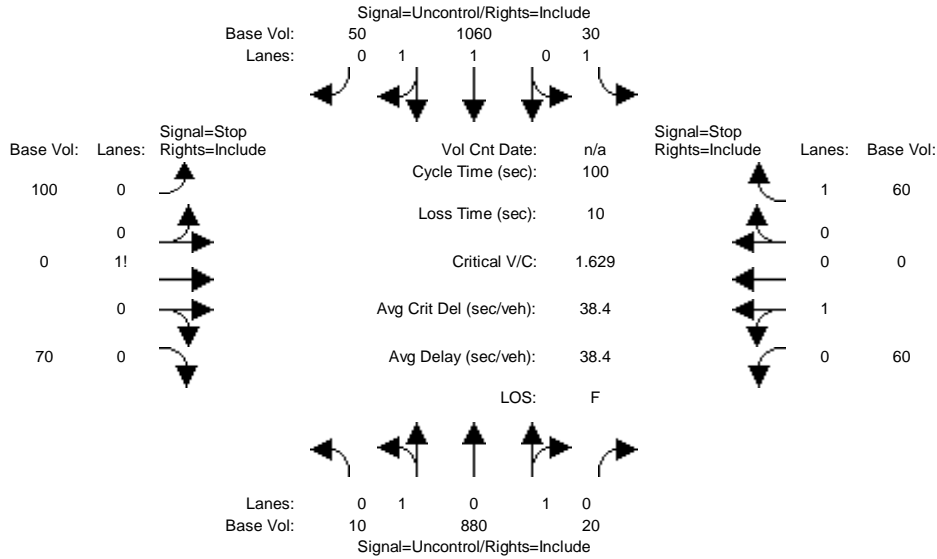

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	26.0	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.5]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=70]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=1930]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #9 University Dr. & Toro Center Dr.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Stop Sign			Stop Sign			Uncontrolled			Uncontrolled		
Lanes:	0	0	0	0	0	0	1	0	2	0	0	1
Initial Vol:	0	0	0	20	0	180	310	360	0	0	390	80
ApproachDel:	xxxxxxx			13.6			xxxxxxx			xxxxxxx		

Approach[southbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.8]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=200]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=1340]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	380 0 50	0 0 0	0 1180 200	10 1010 0
ApproachDel:	1518.4	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=181.4]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=430]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2830]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Approach[eastbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.6]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=60]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=1880]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

Approach[westbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.8]

FAIL - Vehicle-hours less than 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=100]

FAIL - Approach volume less than 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=4][total volume=1880]

SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	280 0 150	0 0 0	0 1040 1040	510 870 0
ApproachDel:	+Inf	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=OVERFLOW]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=430]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=3890]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	280 0 150	0 0 0	0 1040 1040	510 870 0

Major Street Volume: 3460

Minor Approach Volume: 430

Minor Approach Volume Threshold: -160 [less than minimum of 150]

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

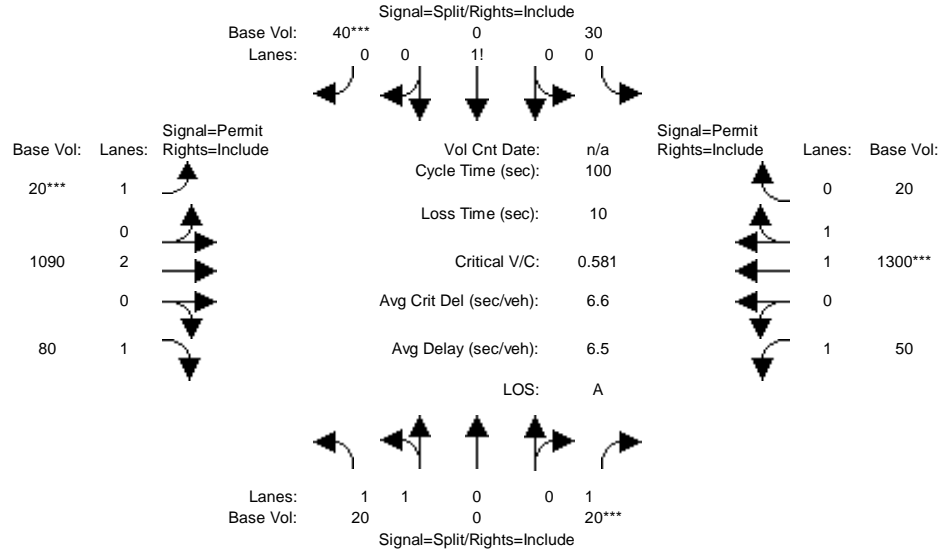

The peak hour warrant analysis in this report is not intended to replace

a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Signal Warrant Rule #1: [vehicle-hours=0.4]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=100]

SUCCEED - Approach volume greater than or equal to 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2260]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

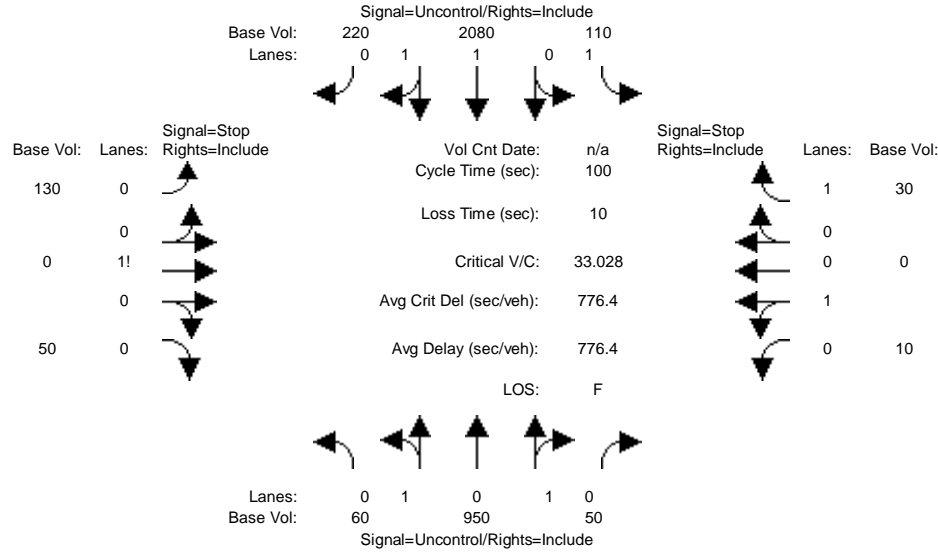

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	+Inf	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=OVERFLOW]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=1250]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=4750]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled

Approach[northbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.3]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=60]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=3040]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #8 University Dr./Birchknoll Dr. Ext.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	0 0 0 0 0	0 0 0 0 1	0 0 2 0 0	0 0 1 1 0
Initial Vol:	0 0 0 0	0 0 150	0 900 0	0 970 250
ApproachDel:	xxxxxx	17.3	xxxxxx	xxxxxx

Approach[southbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.7]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=150]

SUCCEED - Approach volume greater than or equal to 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2270]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #8 University Dr./Birchknoll Dr. Ext.

Peak Hour Delay Signal Warrant Report

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	270 0 140	0 0 0	0 1020 1000	480 860 0
ApproachDel:	+Inf	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=OVERFLOW]
SUCCEED - Vehicle-hours >= 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=410]
SUCCEED - Approach volume >= 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=3770]
SUCCEED - Total volume greater than or equal to 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	1 0 0 0 1	0 0 0 0 0	0 0 2 0 1	1 0 2 0 0
Initial Vol:	270 0 140	0 0 0	0 1020 1000	480 860 0

Major Street Volume: 3360
Minor Approach Volume: 410
Minor Approach Volume Threshold: -147 [less than minimum of 150]

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

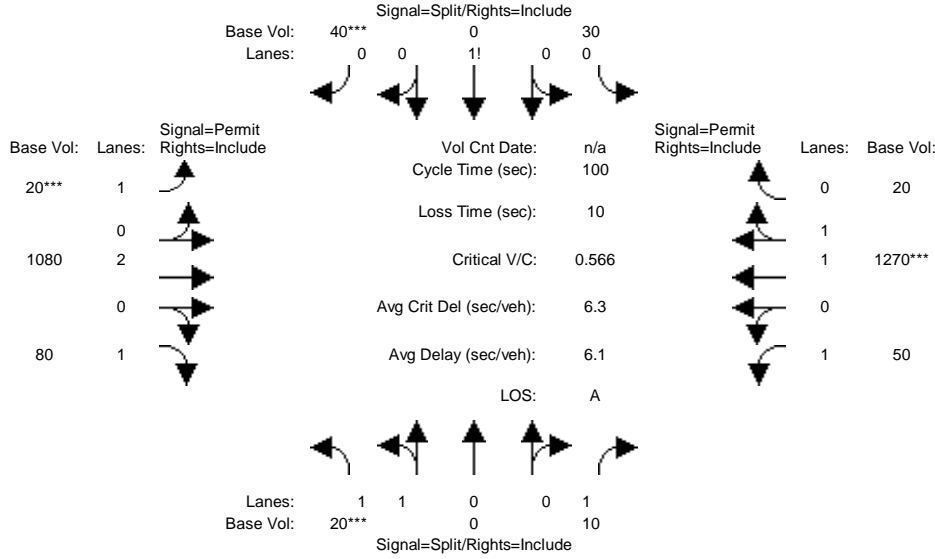

The peak hour warrant analysis in this report is not intended to replace

a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Approach[northbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.4]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=90]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2190]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #8 University Dr./Birchknoll Dr. Ext.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	0 0 0 0 0	0 0 0 0 1	0 0 2 0 0	0 0 1 1 0
Initial Vol:	0 0 0	0 0 120	0 520 0	0 1190 300
ApproachDel:	xxxxxx	19.9	xxxxxx	xxxxxx

Approach[southbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.7]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=120]

SUCCEED - Approach volume greater than or equal to 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2130]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #8 University Dr./Birchknoll Dr. Ext.

ApproachDel:	xxxxxx	xxxxxx	xxxxxx	xxxxxx

Approach[northbound][lanes=2][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=65975.1]

SUCCEED - Vehicle-hours >= 5 for two or more lane approach.

Signal Warrant Rule #2: [approach volume=1200]

SUCCEED - Approach volume >= 150 for two or more lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=4630]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #1 Victoria St. & Drive D

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R

Approach[northbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.3]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=60]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2980]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx	21.3	xxxxxx	xxxxxx

Approach[southbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.7]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=120]

SUCCEED - Approach volume greater than or equal to 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=2220]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #8 University Dr./Birchknoll Dr. Ext.

Base Volume Alternative: Peak Hour Warrant Met

Peak Hour Delay Signal Warrant Report

Intersection #8 University Dr./Birchknoll Dr. Ext.

Base Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	0 0 0 0 0	0 0 0 0 1	0 0 2 0 0	0 0 1 1 0
Initial Vol:	0 0 0	0 0 120	0 530 0	0 1150 420
ApproachDel:	xxxxxx	21.3	xxxxxx	xxxxxx

Approach[southbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.7]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=120]
SUCCEED - Approach volume greater than or equal to 100 for one lane approach.
Signal Warrant Rule #3: [approach count=3][total volume=2220]
SUCCEED - Total volume greater than or equal to 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #8 University Dr./Birchknoll Dr. Ext.

Base Volume Alternative: Peak Hour Warrant Met

Approach:	North Bound	South Bound	East Bound	West Bound

Appendix T

Aerial Photos with Mitigation Measures

Intersection #1, Victoria St./Drive D

2025 Mitigations (in **Blue**):

Signalize

2035 Mitigations (Additional Mitigations in **Peach**):

Signalize, Add 2nd WB Left-Turn Lane, Add 2nd NB Left-Turn Lane, EB Right-Turn Overlap Phasing

- Two-way left turn lane will become a left turn only lane with median
- Driveway to North will need to be changed to right-turn only as left turns are prohibited by the new median

Intersection #3, Victoria St./Birchknoll Dr.

2025 Mitigations (in Blue):

Add 2nd WB Left-Turn Lane

- Requires removal of some on-street parking

2035 Mitigations: Same as 2025 Mitigations

Intersection #5, Central Ave./Charles Willard St.

2025 Mitigations (in **Blue**):

Signalize

2035 Mitigations: Same as 2025 Mitigations

Intersection #6, Central Ave./Beachey Pl.

2025 Mitigations (in **Blue**):
Signalize

2035 Mitigations: Same as 2025 Mitigations

Intersection #9, University Dr./Toro Center Dr.

2025 Mitigations: No Impact

2035 Mitigations (in **Peach**):

Signalize, WB Right-Turn Overlap Phasing, SB Right-Turn Overlap Phasing

Intersection #10, Albertoni St./SR 91 EB Ramps

2025 Mitigations: No impact

2035 Mitigations (in **Peach**):

Convert SB Exclusive Right-Turn Lane to Shared Left/Right-Turn Lane

Intersection #12, Avalon Blvd./Albertoni St.

2025 Mitigations: No Impacts

2035 Mitigations (in **Peach**):

Add 2nd Exclusive EB Right-Turn Lane

- Requires shifting all lanes on the west leg to the north
- Requires converting the shared through/right-turn lane into an exclusive through lane
- Requires removal of on-street parking to accommodate lane shift
- Buses would need to stop in the lane or stops relocated further west

Intersection #13, Avalon Blvd./Victoria St.

2025 Mitigations (in **Blue**):

Add 2nd NB Left-Turn Lane, Convert EB Exclusive Right-Turn Lane to a Through/Right-Shared Lane, Convert WB Exclusive Right-Turn Lane to a Through/Right-Shared Lane

- Second northbound left-turn lane possible by widening northbound approach into the CSUDH green space in the southeast quadrant
- WB Buses would need to stop in the lane or stops relocated further west

Intersection #13, Avalon Blvd./Victoria St.

2035 Mitigations (Additional Mitigations in **Peach**):

Add 2nd NB Left-Turn Lane, Convert EB Exclusive Right-Turn Lane to a Through/Right-Shared Lane, Add Third Exclusive WB Through Lane

- WB Buses would need to stop in the lane or stops relocated further west
- Third WB through lane and second NB left-turn lanes are possible by widening the south and east legs into the CSUDH green space in the southeast quadrant

2025 Mitigations (in **Blue**)

Intersection #14, Central Ave./Artesia Blvd. WB: Add 2nd NB Left-Turn Lane

- Requires widening the overpass structure

Intersection #15, Central Ave./Albertoni St./Artesia Blvd. EB: Add 2nd EB Right-Turn Lane

- Right-turn pocket could be added in green space, reducing sidewalks to minimums near the corners

2035 Mitigations (Additional Mitigations in **Peach**)

Intersection #14, Central Ave./Artesia Blvd. WB: Same as 2025 Mitigations

Intersection #15, Central Ave./Albertoni St./Artesia Blvd. EB: Add 3rd SB Through Lane, Add 2nd EB Right-Turn Lane

- Requires widening the overpass structure

Intersection #16, Central Ave./Victoria St.

2025 Mitigations: No Impacts

2035 Mitigations (in **Peach**):

Add 3rd SB Through Lane, Add EB Exclusive Right-Turn Lane

- Right-turn pockets could be added in green space, reducing sidewalks to minimums near the corners

Intersection #20, I-110 SB Off-Ramp/190th St.

2025 Mitigations (in **Blue**):

Add a SB Left/Right-Shared Lane

- There is enough additional right of way on either side of ramp for additional lane

2035 Mitigations: Same As 2025 Mitigations

Approx. 80 Ft width
(curb to curb)
Additional WB Left-Turn Lane Infeasible

Intersection #22, Figueroa St./190th St./Victoria St.

2025 Mitigations (in **Blue**):

Add 3rd WB Through Lane, Add 3rd EB Through Lane

2035 Mitigations (Not feasible in current right of way):

Add 3rd EB Through Lane, Add 3rd WB Through Lane, Add 2nd WB Left-Turn Lane

- Not enough right of way for additional WB left turn lane

Intersection #23, Broadway/Victoria St.

2025 Mitigations: No Impacts

2035 Mitigations (in **Peach**):

Add 3rd WB Through Lane, Add EB Right-Turn Lane

- Requires removal of on-street parking

Intersection #24, Main St./Victoria St.

2025 Mitigations (in **Blue**):

Add WB Exclusive Right-Turn Lane, Add 3rd EB Through Lane

- Requires removal of on street parking

Intersection #24, Main St./Victoria St.

2035 Mitigations (Additional Mitigations in **Peach**):

Add WB Through Lane, Add 3rd EB Through Lane, Add EB Exclusive Right-Turn Lane

- Requires removal of all on street parking
- EB Right-Turn lane is infeasible due to lack of right of way; would require removing parking from corner lot

For Alternative 2, add
SB Exclusive Right-
Turn in 2025

Intersection #26, Avalon Blvd./Del Amo Blvd.

2025 Alternative 1 Mitigations: No Impacts

2025 Alternative 2 Mitigations: Add SB Exclusive Right Turn

2035 Mitigations (in **Peach**):

Add SB Exclusive Right Turn, Convert the WB Exclusive Right-Turn Lane into an WB Through/Right-Shared Lane

- Would need to shorten the SB shoulder bike lane

Intersection #29, Central Ave./University Dr.

2025 Mitigations: No Impacts

2035 Mitigations (in **Peach**):

Add 2nd EB Left-Turn Lane, Add 2nd SB Right-Turn Lane

- Additional ROW is needed to the northwest

Subject: CSU - EIR Review Period Extension Request

Hi David, Naomi, and Jay

I tried calling David but he is out of the office. I also left a voice mail for Jay. Unfortunately, I could not find a phone number for Naomi.

Regardless, I wanted to talk to at least one of you before I sent this email which is requesting an extension of the review period because of missing information in the EIR.

Below is our official request:

Public participation is an essential part of the CEQA process. (CEQA Guidelines, Section 15201). "Each public agency should include provisions in its CEQA procedures for wide public involvement, formal and informal, consistent with its existing activities and procedures, in order to receive and evaluate public reactions to environmental issues related to the agency's activities. Such procedures should include, whenever possible, making environmental information available in electronic format on the Internet, on a web site maintained or utilized by the public agency." In *Concerned Citizens of Costa Mesa, Inc. v. 32nd District Agricultural, Assoc.* (1986) 42 Cal. 3d 929, the court emphasized that the public holds a "privileged position" in the CEQA process "based on a belief that citizens can make important contributions to environmental protection and on notions of democratic decision making." For this 2019 Campus Master Plan Project, the Noticed of Availability of the Draft EIR was published on the CSU website on February 11, 2019 (the EIR was not actually accessible until February 12, 2019), the EIR's Transportation Impact Study appendices, did not include (traffic count sheets, volume development worksheets, LOS worksheets, etc.). In addition, volume figures in the traffic study do not show turning volumes correctly. It appears that Adobe is substituting fonts for the volume figures (see screen shot below); therefore, the Public cannot adequately review and meaningfully participate in the environmental review process. This is because essential components of the EIR are not accessible to the public and the public is unable to review the whole of the Project and its impacts. Therefore, the City is requesting CSU extend the public review period by at least 10 additional days to April 8, 2019, to allow for adequate

Re CSU - EIR Review Period Extension Request.txt
time for the City and public,
to review and comment on the EIR in its entirety.

Thanks

Subject: FW: CSU EIR Missing Information

Hi All

Our traffic Engineer found more missing information that makes determining the impacts impossible. This would also require an extension to the review period. Please see below.

Here's what we need -

1. Volume development worksheets. As requested earlier, please show how the future volumes were developed. At this time, there are intersections where the future (no project) volumes are increasing by 200% compared to existing volumes for one approach and increasing by 5% for another approach. There are no explanations as to how volumes were developed. Please provide volume development worksheets.
2. Project Trip Distribution & Assignment. Per our previous request, please provide trip distribution and assignment figures (or tables). Since different land uses are likely to have different distribution patterns. The TIS, for example, shows the zip code maps from where faculty, staff and students come from, which is likely to be different from those coming to the retail, residential, and office type uses.

This information is vital to the review of the TIS.

Thanks

Saied Naaseh

*Re: California State University Dominguez Hill (CSUDH) 2018 Campus Master Plan
Draft Environmental Impact Report (EIR) Information Request*

Mr. Naaseh: *SAIED -*

This letter is in response to your e-mail dated March 8, 2019, by which you requested the following information related to the traffic analysis presented in the CSUDH Draft EIR, currently out for public review:

- 1. Volume development worksheets. As requested earlier, please show how the future volumes were developed. At this time, there are intersections where the future (no project) volumes are increasing by 200% compared to existing volumes for one approach and increasing by 5% for another approach. There are no explanations as to how volumes were developed. Please provide volume development worksheets.*
- 2. Project Trip Distribution & Assignment. Per our previous request, please provide trip distribution and assignment figures (or tables). Since different land uses are likely to have different distribution patterns. The TIS, for example, shows the zip code maps from where faculty, staff and students come from, which is likely to be different from those coming to the retail, residential, and office type uses.*

In response to your request, we provide the following information:

1. Future Volumes

The Transportation Impact Study (TIS) for the 2018 Campus Master Plan, which was prepared by transportation engineers with WSP, is provided in its entirety in Draft EIR, Appendix G. TIS Sections 9 and 11, respectively, present the future 2025 and 2035 No Project conditions. As explained in Section 9.1, traffic volumes for the 2025 No Project condition were developed by factoring up the existing weekday traffic counts using the growth factor from the Los Angeles Congestion Management Plan and then adding in the traffic for existing, known, and reasonably foreseeable projects. The resulting 2025 No Project traffic volumes are shown on Exhibit 87. As explained in Section 11.1, a similar process was utilized to determine 2035 No Project volumes, which are shown on Exhibit 106. This methodology is consistent with industry best practice.

As to the comment regarding “intersections where the future (no project) volumes are increasing by 200% compared to existing volumes for one approach and increasing by 5% for another approach,” as explained above, the future No Project Scenario includes traffic that would be generated by certain other reasonably foreseeable projects, which would affect traffic in the vicinity of the University; these other projects are listed in TIS Exhibit 85. Additionally, other future projects not yet specifically identified would generate traffic that is captured through the global increase in traffic volumes calculated per the LA County CMP and included within the No Project scenario. These combined future projects will result in increased background traffic volumes that would not be evenly distributed throughout the study area and, instead, would increase more in some locations and less in others, as is typical of travel patterns, dependent upon the location of the various land uses.

2. *Trip Distribution and Assignment*

The trip distribution and assignment used in the TIS also follows industry best practice. As explained in TIS Section 5.5, the distribution for the campus population (students, faculty, and staff) was derived based on existing campus address data. The distribution for the proposed new uses (i.e., business park, market-rate apartments, etc.) followed the procedure outlined in Appendix D of the Los Angeles County Congestion Management Plan using the trip distribution tables found in Exhibit D-3 (see: http://media.metro.net/projects_studies/cmp/images/CMP_Final_2010.pdf).

Section 5.5 of the TIS provides an explanation of the trip generation and distribution process utilized by the traffic engineer. Exhibit 34 provides a step-by-step explanation of how this was done. Exhibits 39, 40, and 41, respectively, illustrate the distribution of off-campus students, faculty, and staff, along with an explanation of how the exhibits were used for trip distribution purposes. TIS Section 5.6 includes separate trip distribution calculations relating to the proposed StubHub Center seating increase. As to the proposed retail, residential, and office uses, the distribution was calculated consistent with LA County CMP procedures, as explained above.

In conclusion, CSUDH appreciates Carson’s interest in the project and looks forward to continuing to work cooperatively with the city towards project development. In the event the City’s traffic engineer would like additional explanation regarding the information presented in the TIS, the EIR traffic engineer would be happy to discuss it in a conference call.

Appendix G. Utilities

G.1 DES Utilities Engineering (Appendix B.2 of the Master Plan Guidelines 2018)

B.2: DES Utilities Engineering

The **University Village** is an urban design concept within the CSUDH 2018 Master Plan that integrates the academic core and the student residential community with a neighborhood of retail and business communities and residential apartments to create a live/work/play environment with synergistic connections to the University's mission and purpose. The **Land Development Project** (LDP) is a privately-financed and developed mixed-use project on 76.5 acres within the University Village that includes high-quality rental housing for faculty, staff and community members; retail development; and business park development. It is anticipated that the LDP would be developed as a public-private partnership (P3) which could be constructed over a period of years. Student Residence Halls (Parcels 2A and 2B) and Student Apartments (Parcel 3A) are part of the University Village, but are not currently envisioned as part of the LDP P3 land development.

Unless otherwise noted, the analyses and reports produced for this Appendix include all the parcels of the University Village and are not confined to the parcels of the Land Development Project.

PART A: CAMPUS COOLING INFRASTRUCTURE

A. EXISTING SYSTEMS

The campus central plant has currently two, 1,000 Ton gas fired absorbers that provide cooling to most of the core campus buildings that total approximately 1 million GSF (See Table 1 and Figure 1). Historical observation is that the actual current load is of the order of 1,650 Tons or roughly 600 GSF/Ton.

The campus chilled water distribution system consists of a non-loop system, with a 24" diameter supply header at the central plant. The plant deploys two distribution pumps, each rated at 2,500 GPM to distribute chilled water to the core campus buildings. Generally, under present load conditions, only one pump operates at any time. A single pump, can deliver nearly 1,666 Tons when the chilled water supply and return temperature differential is 16 deg. F. A vast majority of the chilled water steel piping system is in tunnels whereas some of the branch piping to remote parts of the distribution system is in direct buried steel pipes.

The existing plant building includes a 15 MMBtuh boiler as well as all hot water heating pumps, chilled water primary and secondary pumps, and the operator control room, electrical switchgear room, and small administrative offices. There is no room inside the existing plant building to add additional chillers (See

Figure 3). The cooling towers and condenser pumps are situated to the east of the existing central plant, within the same overall central plant yard.

FIGURE 2. EXISTING CHW SYSTEM

B. SYSTEM CHANGES UNDERWAY (JULY 2017)

A cooling tower replacement project is underway to replace the existing cooling towers that have deteriorated beyond repair. Once these new towers are in place, the towers can provide cooling capacity for 2,400 Tons through high efficiency electric chillers. The cooling tower structure that is being built can accommodate one more tower cell, bringing the total tower capacity to 3,200 Tons as future loads increase.

Since the existing chillers have also nearly reached the end of their useful life and there is a strong desire on part of the campus to reduce the GHG foot print through the use of high efficiency electric chillers, there is a strong likelihood that the existing absorption chillers will be replaced over the next three years. There are currently plans under way to build the first of the three 800 Ton electric chillers to help the central plant meet the additional loads associated with the new Science building which is in design and which is expected to demand approximately 400 Tons. The 800-Ton chiller would work in concert with the existing absorption chillers until there is funding available for replacing both the old absorption chillers with new electric chillers. The plant yard area which is south east of the existing plant building has been targeted as the potential spot for a new cooling system consisting of one or more electric chillers.

C. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 2 summarizes the potential buildings being considered for development as part of the Master Plan. Table 2 shows the area for the Core campus which is within reasonable reach of the existing central plant

Based on addition of about 1.7 million GSF of buildings per Table 2 (net of any buildings that would be replaced), the long term cooling loads that need to be met by the campus cooling infrastructure is estimated at 4,400 Tons. This is based on a diversified load index of 600 GSF/Ton for academic buildings and 750 GSF/Ton for the housing complex, which is comparable to observed diversified cooling intensity based on existing building systems.

TOTAL		1,612,926

TABLE 2. CORE CAMPUS - POTENTIAL BUILDINGS

FIGURE 3. EXISTING CENTRAL PLANT LAYOUT

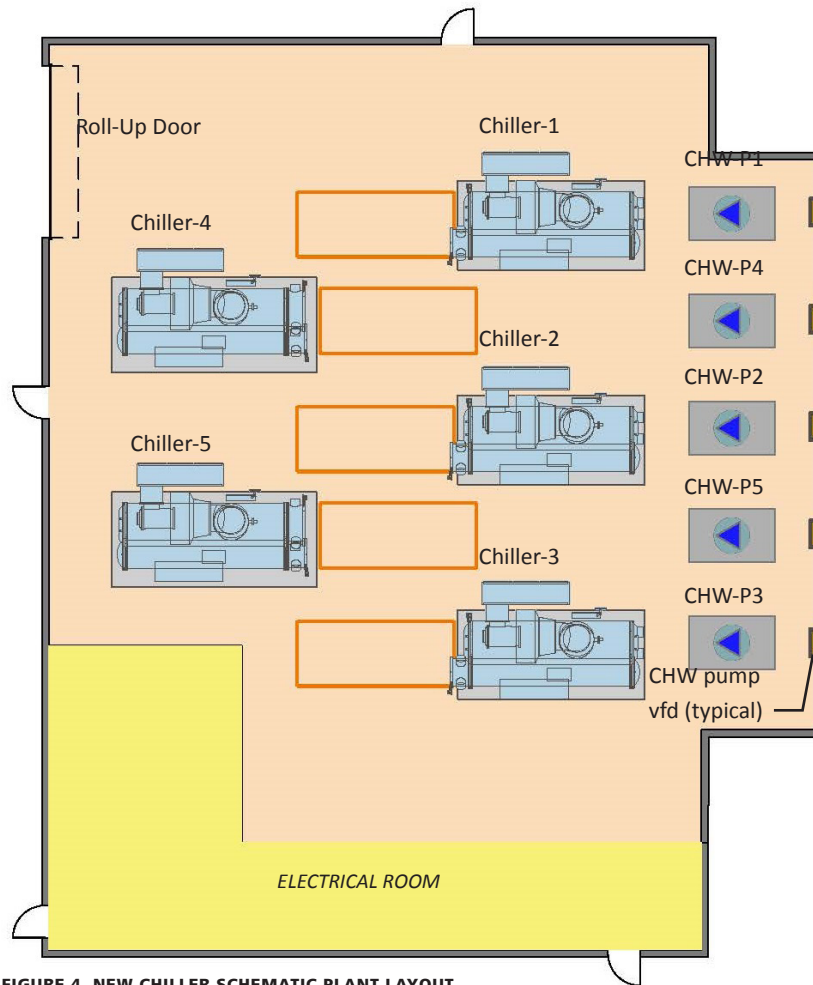

FIGURE 4. NEW CHILLER SCHEMATIC PLANT LAYOUT

D. MEETING LONG TERM COOLING LOADS WITHIN THE CORE CAMPUS

Assuming that the campus secures funding for the conversion of the central plant from the present absorption based cooling system to the electric cooling system, here is one potential scenario for accommodating the 4,400 Tons of long term cooling demand.

1. Provide a new electric chiller plant building inside the existing plant yard (Figure 3). This electric chiller plant building will have eventually FIVE, 800 Ton high efficiency electric chillers. FOUR of these make up a total capacity of 3,200 Tons and one of the chillers will be a redundant chiller.
2. The existing chilled water primary pumps would become obsolete as new electric chillers and associated new primary pumps are installed. In their place, an additional chilled water distribution pump of comparable capacity (e.g., 2,500 GPM, 150 ft. head) would be added to provide the needed redundancy in chilled water distribution capacity.
3. An additional cooling tower cell would be added to bring the total cooling tower capacity to 3,200 Tons of electric chillers.
4. An additional condenser water pump would be added to provide required redundancy as the electric chiller plant is fully built out
5. To help avoid high demand charges associated with the electric chiller plant, add a Thermal Energy Storage Chilled water tank that is approximately 60 ft.in diameter and 96 ft. tall, to provide up to 24,000 Ton Hours of cooling. Such a tank would therefore provide approximately 4,000 Tons of cooling for 6-hours.
6. The existing absorption chillers in the central plant would be removed. Space cleared would be used for providing any needed space for additional boilers required for meeting future heating loads.
7. As campus needs an additional 1,200 Tons of capacity (to reach up to the 4,400 Tons stated in paragraph C. above), consider satellite plant(s) that are interconnected to the central chilled water distribution piping. Figure 5 shows possible locations of satellite plants. Options include a Satellite Plant for the Housing area (SP1), a satellite plant for the North west portion development of the core campus (SP2), and a possible location (SP3) in vicinity of the proposed Recreation center building. Any two of these satellite plant locations could be used to provide the needed incremental capacity of approximately 1,200 Tons.
8. Typically, the satellite plants could consist of either air cooled chillers (for example, 2, 300 Ton air cooled chiller at each satellite plant location) or water cooled chillers and a cooling tower at each location. Choice of actual configuration would be developed based on noise, space

availability, etc. at each applicable location. The satellite plant with a capacity of 600 Tons would need an approximate footprint of 30' x 50'.

9. Also shown in Figure 5 are piping upgrades required to distribute chilled water to the core campus buildings.

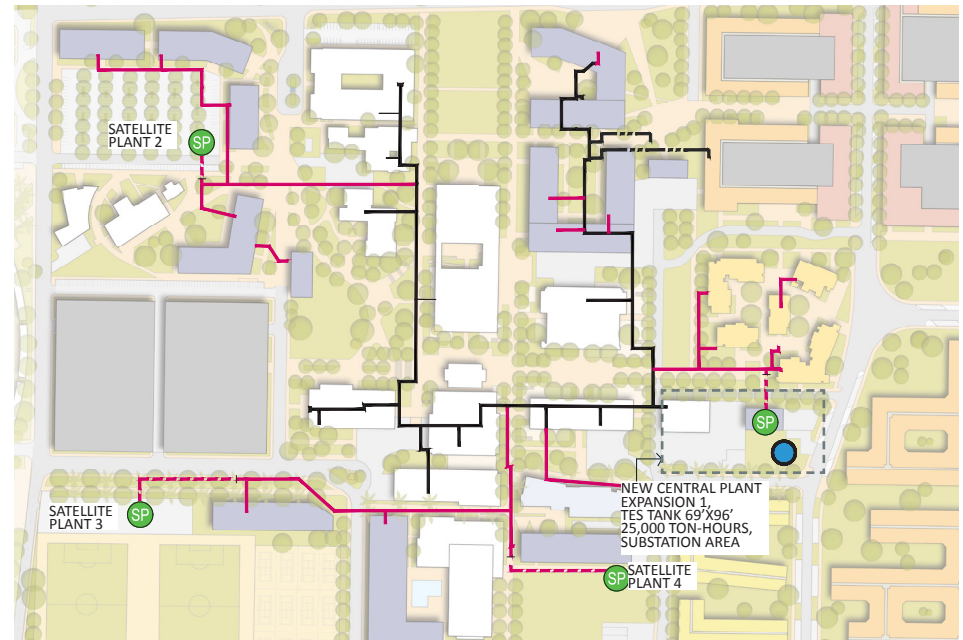

FIGURE 5. NEW CHW DISTRIBUTION AND POSSIBLE SP LOCATIONS

PART B: LDP AREA COOLING INFRASTRUCTURE

A. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 3 summarizes the potential private/public partnership buildings being considered for development as part of the Master Plan in the LDP area. The types of development include 1.9 million GSF of parking structures, 2.6 million GSF of multi-family residential units, 96,085 GSF of retail areas, 536,264 GSF of apartments and 572,400 GSF of business park buildings. Figure 6 shows the LDP buildings. The combined long term cooling loads associated with this development is estimated at approximately 5,550 Tons.

B. MEETING LONG TERM COOLING LOADS WITHIN THE LDP AREA

Since there is very little certainty on how and when these buildings will be developed through private investment, it would be difficult for a prospective developer to sink in funds for developing a single central plant and chilled water distribution system that would be capable of handling the entire long term loads expected in the LDP area. Distributing up to 5,550 Tons could entail a 24" pipe at the central plant. Depending on how these buildings are phased, it is conceivable that three different central plants or satellite plants could be developed. For instance, the entire region can be grouped into three zones (North, Center and South) or grouped by type of buildings that would be developed. When the plant capacity is only 2,000 Tons for instance for a localized plant, the pipe size requirement for distribution reduces to 14".

A more realistic possibility is that each building could be developed on its own, with an in-building chiller that is capable of being tied to a potential common loop that would serve future adjacent buildings within that zone. This strategy provides the opportunity for a prospective building developers to have minimal overheads associated with the initial development cost. Flexibility would be retained to tie the chiller(s) in any building to chiller(s) in the next building that would be developed. Pathways for chilled water piping connecting the buildings could be left clear for the construction of future piping connections. The mechanical rooms and chiller rooms would be strategically situated in each building so that the overheads associated with future piping interconnections are minimized.

The upside of the distributed chiller concept is that risk for a developer would be minimized since substantial investment with cooling infrastructure would not burden any single building. The downside is that long term maintenance cost would be greater in comparison with a central chiller plant.

Either the distributed chiller option or the central plant(s) option can be designed with thermal energy storage as a component in the overall design. The type of thermal storage system that would be cost effective would vary and the pumping schemes would vary depending on which of the cooling infrastructure option is pursued.

PART A: CORE CAMPUS HEATING INFRASTRUCTURE

A. EXISTING SYSTEMS

The campus central plant has currently one, 12 MMBtuh output gas fired boiler for providing central hot water heating to approximately 875,000 GSF of core campus buildings (See Table-1). In addition, each of the two absorption chillers have the capability to provide an estimated 12 MMBtuh of heat, if called upon to supplement the boiler heating capacity.

The campus hot water distribution system consists of a non-loop system, with a 10" diameter supply header at the central plant (See Figure 1). The plant deploys two distribution pumps, each rated at 1,000 GPM to distribute hot water at around 180 deg. F to the core campus buildings. Generally, under present load conditions, only one pump operates at any time and one remains as a standby pump. Based on campus heating season experience, the heating demand has rarely been greater than 12 MMBtuh. It appears that the original intent was that the hot water heating system would operate at a temperature differential of 60 deg. F. However, during a majority of the time, the hot water temperature differential between supply and return remains under 30 deg. F. Therefore, the realistic maximum heating capacity of the existing infrastructure at the 1,000 GPM pumping rate of the secondary hot water pump is approximately 15 MMBtuh.

B. SYSTEM CHANGES UNDERWAY (JULY 2017)

The new Science center building will be connected to the existing heating hot water system. It is expected that with this building added to the loop, the heating load would jump to an estimated 15 MMBtuh. Currently, the combination of existing boiler and the absorption chiller-heaters can carry the load. However, if these absorption chillers were to be removed from service, campus will need to provide new small boilers to meet the peak heating load of 15 MMBtu for the existing loop, with the Science building added.

TABLE 1. EXISTING BUILDINGS SERVED BY HHW PIPING

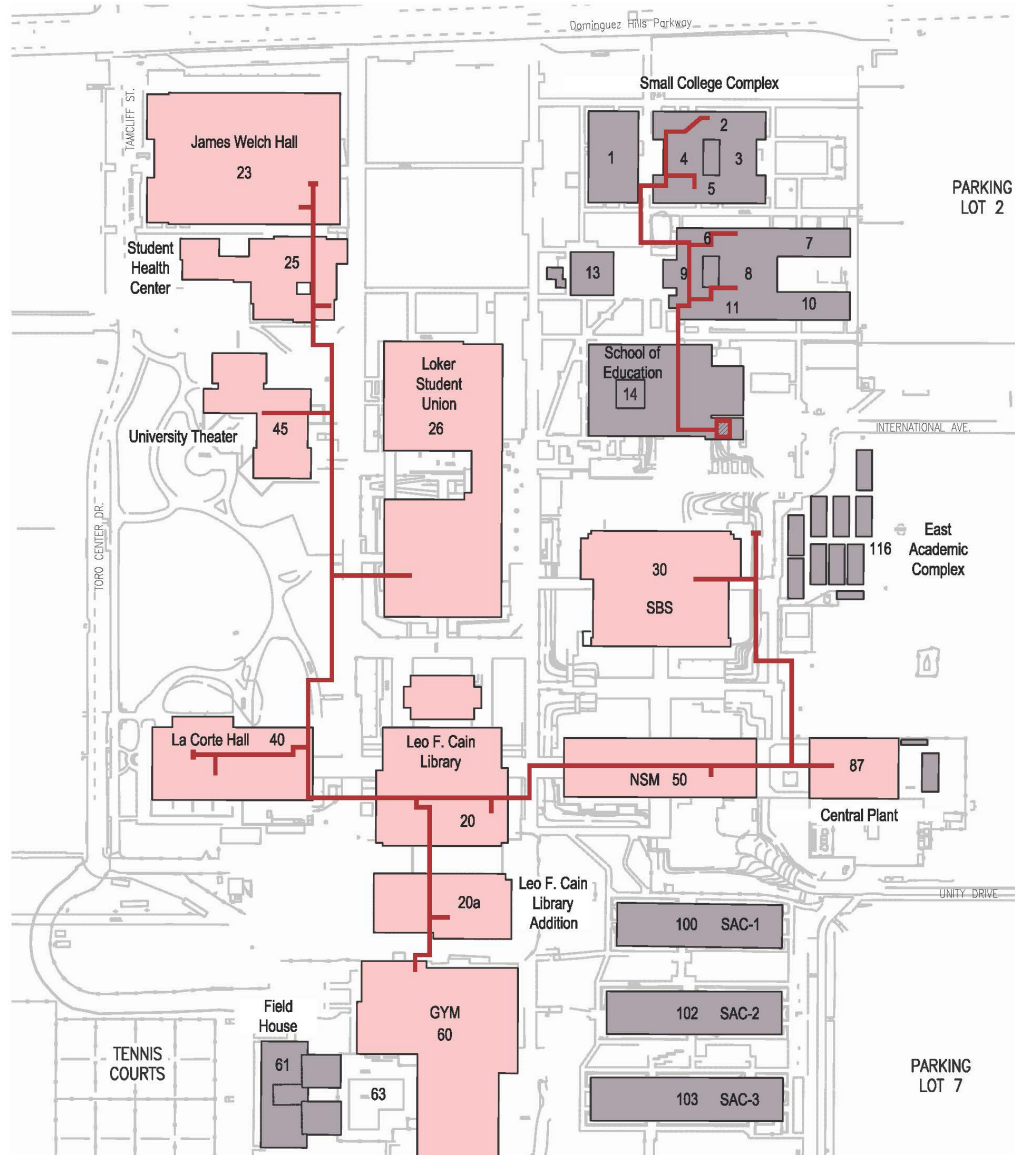

FIGURE 2. EXISTING HHW PIPING

C. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 2 summarizes the potential core campus buildings being considered for development as part of the Master Plan. The listed core campus area buildings are within reasonable reach of the existing central plant.

Based on addition of about 1.7 million GSF of buildings per Table 2 in the core campus, the long term additional heating loads that need to be met by the campus heating infrastructure is estimated at 35 MMBtuh. Of this, the housing complex is expected to be approximately 9 MMBtu and the rest of the new core campus buildings would be approximately 26 MMBtuh. For planning purposes, these estimates use a heating index of 25 Btuh/SFT for housing and 20 Btuh/SFT for rest of the new buildings. The higher index for housing is to accommodate the higher domestic hot water needs due to shower water and dining facility needs.

D. MEETING LONG TERM HEATING LOADS WITHIN THE CORE CAMPUS

Since hot water heating systems entail much more thermal losses in comparison with chilled water distribution systems (primarily due to large temperature differential between ambient and fluid temperature), it would be prudent for the campus to consider a more distributed form of heating system over the long term for planning purposes. With the availability of more efficient condensing boilers that operate at 90% plus efficiency as opposed to the present 75-80% efficiency of central boilers, locating heating capacity in future buildings right within the building helps eliminate distribution losses associated with direct buried piping. Numerous institutions have continually experienced losses and leaks in direct buried hot water distribution system piping and the distributed boiler strategy will also assist in reducing long term maintenance costs associated with hot water piping infrastructure.

Based on the above, this plan does not recommend making significant expansion efforts on the central heating system infrastructure. However, to make the existing system(s) more efficient, the following long term changes are recommended.

1. Replace the existing large 12 MMBtuh boiler with smaller modular boilers, with condensing capability that could be used at least during low load periods.
2. As the old chillers are removed and new electric chillers are provided, provide an addi-

tional capacity in heating for achieving a minimum level of redundancy. The long term configuration could consist of six, 3 MMBtu (input) boilers. Three each could be mounted on each pad currently occupied by the chillers. This will handle existing core campus loads and the proposed new Science building.

3. All new core area buildings would have their own boilers. The combined installed capacity of these boilers is expected to be approximately 32 MMBtuh.

Figure 3 shows the scheme for locating modular condensing boilers within the existing central plant. Figure 4 shows the new hot water piping schematic to the new science center building.

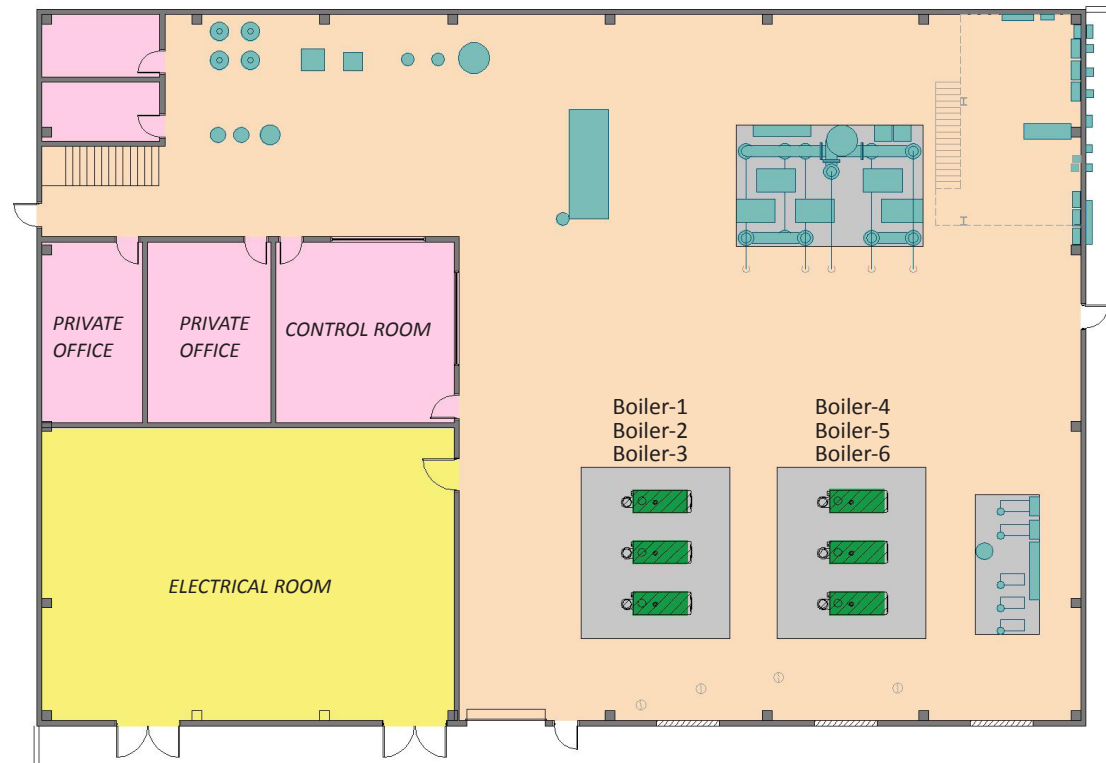

FIGURE 3. BOILER LAYOUT AT CENTRAL PLANT

PART B: LDP AREA HEATING INFRASTRUCTURE

A. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 3 summarizes the potential private/public partnership buildings being considered for development as part of the Master Plan in the LDP area. The types of development include 1.9 million GSF of parking structures, 2.6 million GSF of multi-family residential units, 96,085 GSF of retail areas, 536,264 GSF of apartments and 572,400 GSF of business park buildings. Figure 5 shows the LDP buildings. The combined long term heating loads associated with this development is estimated at approximately 90 MMBtuh.

B. MEETING LONG TERM HEATING LOADS WITHIN THE LDP AREA

Since there is very little certainty on how and when these buildings will be developed through private investment, it would be difficult for a prospective developer to sink in funds for developing a single central plant and hot water distribution system that would be capable of handling the entire long term loads expected in the LDP area. Additionally, it is better to avoid distribution losses in its entirety by placing in-building boilers in each building or each building cluster. Therefore, this plan envisions that each building or groups of buildings within close proximity to each other would have their in-building boilers. The boilers would be typically on the building roof and each building would have its own hydronic distribution pumps to circulate heating hot water through the various heating coils. Roof location for boilers makes it less complex to build flue. Ideally, each building would accommodate a small penthouse for mechanical systems which would include boiler(s) for meeting hot water heating needs.

Based on a combined building development plan of an estimated 3.8 Million GSF (excluding parking structures which do not require any heating), the combined heating capacity in in-building boilers would be approximately 90 MMBtuh.

PART A: CORE CAMPUS NATURAL GAS INFRASTRUCTURE

A. EXISTING SYSTEMS

The CSU Dominguez Hills campus has over 15,000 lineal feet of natural gas distribution piping underground and in the tunnel system. This piping can be grouped into the following three categories:

- 1) Southern California Gas Piping (9,500 feet)
- 2) CSU Piping Underground (2,800 feet)
- 3) CSU Piping in Tunnels (2,700 feet)

Southern California Gas (SCG) has main gas lines entering the campus at five different locations. SCG owns and is responsible for the piping up to the meter. Table 1 summarizes the areas served by each SCG main line entrance and respective campus area served. Figure 2 presents a schematic of the existing natural gas infrastructure.

A large part of the natural gas demand for the core campus is attributed to the campus' central heating hot water and chilled water system. For heating hot water, the plant currently has one, 12 MMBtuh output gas fired boiler. For chilled water, the plant has two 1,000 Ton gas-fired absorption chillers. If needed, the absorption chillers are also capable of providing heating hot water to supplement boiler heating capacity.

Main Gas Service Location	Campus Area Served	Meter Location
Victoria Street (1 of 3)	1) Extended Education (Bldg 106)	Building 106
Victoria Street (2 of 3)	1) School of Education (Bldg 14) 2) Small College Complex (Bldgs 1-11, 13)	Building 14
Victoria Street (3 of 3)	1) Student Housing SH-1 (Bldg 70)	Meter at Each Building
Central Avenue	1) Student Housing SH-2 (Bldg 71)	Meter at Each Building
	2) Central Plant (Building 87) & Remaining Campus Bldgs *	Central Plant
	3) South Academic Complex 1, 2, 3 (Bldgs 100, 102, 103, 104)	Building 100
	4) California Academy of Math and Science (Bldg 107)	Building 107
University Drive	1) Physical Plant (Building 80)	At Physical Plant

* Gas from the central plant serves the remaining buildings on campus through the tunnel.

TABLE 1. EXISTING SCG GAS LINES AND AREAS SERVED

B. SYSTEM CHANGES UNDERWAY (JULY 2017)

There are presently no known changes planned or in the works for the natural gas infrastructure.

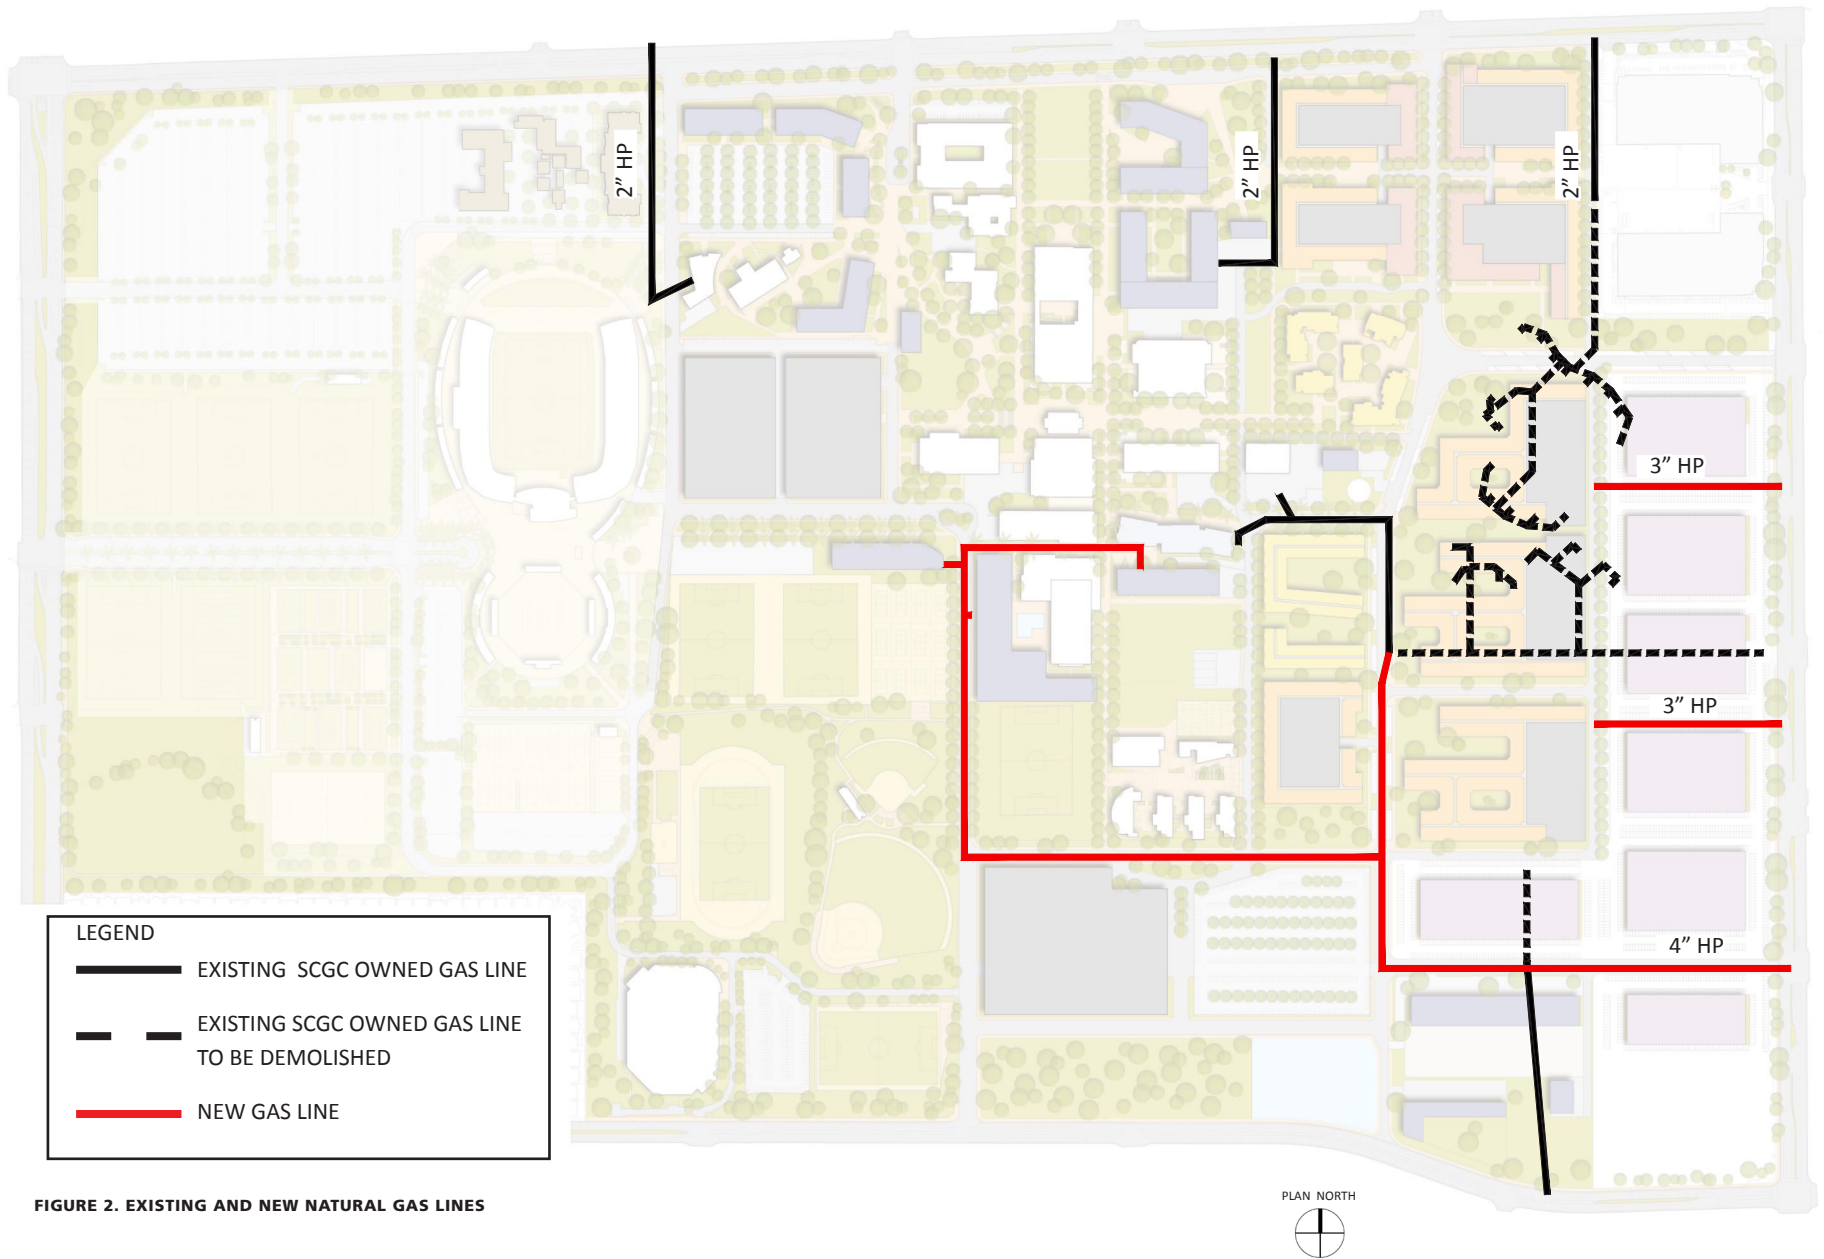

FIGURE 2. EXISTING AND NEW NATURAL GAS LINES

C. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 2 summarizes all the potential core campus buildings being considered for development as part of the Master Plan.

As was outlined in the heating infrastructure section, all new buildings considered for development in the Master Plan are proposed to have in-building natural gas fired boilers to meet their heating needs. Aside from the New Science Building which is presently in construction, none of the new buildings will be tied to the central plant HHW loop.

Based on addition of about 1.7 million GSF of buildings per Table 2, the long term additional gas heating loads that need to be met by the natural gas infrastructure is estimated at 38 MMBtuh. Of this, the housing complex is expected to be approximately 9 MMBtuh and the rest of the new core campus buildings would be approximately 29 MMBtuh. For planning purposes, these estimates use an index of 25 Btuh/SFT for housing and 20 Btuh/SFT for rest of the new buildings. The higher index for housing is to accommodate the higher domestic hot water needs due to shower water and dining facility needs.

D. MEETING LONG TERM NATURAL GAS NEEDS WITHIN THE CORE CAMPUS

The existing Core Area gas heating peak is estimated as 16 MMBtuh. With addition of 38 MMBtuh for the new Core Area heating needs, the total long term Core Area gas peak is estimated as 54 MMBtuh.

Note that the existing absorption chillers are proposed to be replaced with new electric chillers in the future. This will ultimately reduce the required natural gas capacity of the campus.

Since all new buildings in the Master Plan are proposed to have in-building boilers, new natural gas lines will be need to be routed to each. Figure 2 shows the proposed natural gas infrastructure system with natural gas lines to each new building. The figure also shows the gas lines to be demolished and rerouted because of obstructions in the proposed building locations.

The majority of new core campus buildings can likely be picked up by the two 2" SCG gas lines at Victoria Street. For each new building that is tied in to an existing gas line, careful consideration gas pressures, pipe size, and expected losses needs to be taken. Campus will need SCG approval for all gas modifications.

One important item of note is that the existing SCG gas line at Central Avenue will need to be demolished and relocated when the LDP area buildings are developed. Because this

TOTAL		1,702,203

TABLE 2. CORE CAMPUS - ALL CORE CAMPUS BUILDINGS

line is critical and presently serves heating and cooling needs of the campus, demolition of the existing line will only occur after a new line is installed and ready to serve present loads.

A 4" line carrying 60 SIG gas will have a pressure drop of less than 10% when 54 MMBtuh of long term gas has to be transported over approximately 3000 feet. This length corresponds to a new line that SCG will need to bring to the Central Plant location. Such a line would be sufficient for meeting long term core campus needs.

PART B: LDP AREA NATURAL GAS INFRASTRUCTURE

A. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 3 summarizes the potential private/public partnership buildings being considered for development as part of the Master Plan in the LDP area. The types of development include 1.9 million GSF of parking structures, 2.6 million GSF of multi-family residential units, 96,085 GSF of retail areas, 536,264 GSF of apartments and 572,400 GSF of business park buildings. Figure 3 shows the LDP buildings.

The long term additional gas heating loads that need to be met by the natural gas infrastructure is estimated at 90 MMBtuh. For planning purposes, these estimates use an index of 25 Btuh/SFT for multi-family residential units and apartments, 20 Btuh/SFT for business park buildings, and 15 Btuh/SFT for retail buildings.

B. MEETING LONG TERM NATURAL GAS NEEDS WITHIN THE LDP AREA

A vast majority of the existing gas piping serving the east end of the campus (i.e., mainly housing buildings) will need to be demolished to accommodate the proposed new LDP area development. Existing gas lines to this area feed from Victoria Street, Central Avenue, and

University Drive.

The LDP development entails a long term load of approximately 90 MMBtuh. A 3,000 ft. long line carrying gas in a 6” pipe will be able to deliver the same to a common metering point if that option is ever pursued. More likely, SCG would consider providing long term capacity in three phases. Each phase could represent a tap off their main line that runs North South along Central Avenue.

Each such phase could involve a 3” line operating at 60 psig. that can carry gas over approximately 2000 feet with less than 10% pressure drop. Each such line would be capable of supporting roughly a third of the long term demand of 90 MMBtuh.

Figure 2 presents the proposed three phase approach for new natural gas service lines to serve the LDP Area.

SUMMARY

Part A

Estimates for photovoltaic potential were determined for the core campus area based on layout of PV arrays, using the solar module Solarworld-350. Each array consists of anywhere between 120 and 4,980, in strings of twelve modules, with a combined circuit voltage of 576 Volts (DC). It is assumed that the overall installation will have distributed inverters on the roofs of the buildings and structures, with the AC output delivered to a common switchboard in the electrical room. The core campus area has a potential of 7.6 MW of PV. This is based on using a maximum of 40% roof area for buildings, and allowing the balance for access as well as potential HVAC equipment.

Part B

The LDP area photovoltaic potential is projected based on assuming 21 sq. ft. per installed PV module, for a maximum of 33% of total roof area for buildings and 48% roof area for parking structures, the average percent coverages on the core campus buildings.

The overall campus photovoltaic potential is summarized as 7.6 MW for the core campus, and 7.1 MW for the LDP building rooftops and 2.8 MW for the LDP parking structures, a total of 9.9 MW for the LDP.

NOTES

1. The photovoltaic panel type and module used in this design is Solarworld monocrySTALLINE SW-350 with dimensions of 78.46”L X 39.4”W.
2. Panels are tilted at 12° and the gap provided between panels is 1/2”.
3. Array types are fixed (low-framed sloped rail racking system) for rooftop and ground mount systems, and fixed (canopy-single and double bay) for parking structure systems.
4. AC generation is estimated at 1,500 kWh per kW DC installed.
5. Minimum gaps of 20’ are provided on all rooftops as provision for mechanical system space.

TABLE 2. LDP PROJECTED CAPACITIES

NOTES

Projected PV for the LDP based on the benchmark of an average 33% coverage for core building rooftops and 48% coverage for core parking structures.

LDP potential capacities are 20,292 panels for 7.102 MW installed and an estimated 10,653,300 kWh generated, for building rooftops, and 8,016 panels for 2.806 MW installed and an estimated 4,208,400 kWh generated, for parking structures.

ENERGY USAGE AND GHG EMISSIONS

A. EXISTING ENERGY USE AND GHG EMISSIONS

During the latest calendar year (2016), campus energy use records indicate that the overall electricity use was 16.5 million kWh and Natural Gas usage was approximately 985,000 Therms. For the 1.25 million GSF of buildings on campus, this is equivalent to a site energy use index of 12.9 kWh/GSF for electricity and 0.79 Therms/GSF for natural gas. The overall site Energy Use Index (EUI) is estimated as 122,708 Btu/kWh. The existing GHG (Scope 1 and Scope 2) emissions are estimated at 10,068 Tons, which is approximately 3,803 Tons greater than the 1990 emission levels recorded at campus based on the 1990 energy use levels (See Figure 1).

FIGURE 1. GHG EMISSIONS (METRIC TONNES) 2016 VS. 1990 LEVELS (REDUCTION REQUIRED PER AB 32 - 3,803 TONNES)

B. ONGOING AND FUTURE CONSERVATION EFFORTS

One of the significant sources of GHG emissions is presently the two, 1,000 Ton gas fired absorption chillers that are used for providing cooling to a majority of the campus buildings. Conversion of the gas based absorption cooling to an electric chiller based cooling system using high efficiency electric chillers will result in a substantial reduction in the GHG footprint. Best estimates show that the proposed conversion will reduce GHG footprint by approximately 2000 Tons/year as shown below in Table 1.

Peak Tons	Annual Use (Ton Hours) [3]	Absorber Therms/Ton [1]	Annual Gas Use (Therms)	GHG lbs./Therm	GHG Emissions (Lbs./Year)	GHG Emissions, Metric Tons/Year
1600	2,522,880	0.18	454,118	11.69	5,308,142	2,408
Peak Tons	Annual Use (Ton Hours)	Electric Chiller kW/Ton [2]	Annual Electricity	GHG lbs./kWh	GHG Emissions (Lbs./Year)	GHG Emissions, Metric Tons/Year
1600	2,522,880	0.55	1,387,584	0.65	895,463	406
Reduction Expected with All Electric Chiller Configuration (Metric Tons/Year)						2,002

TABLE 1. GHG REDUCTION THROUGH CONVERSION TO ELECTRIC CHILLERS

In addition, the campus continually strives to enhance the energy efficiency in buildings through a variety of measures. The ongoing and future measures are expected to include such projects as:

- Renovation of building lighting systems using LED lighting technology
- Use of smart lighting controls where every fixture has the capability to be programmed and dimmed based on occupancy and daylight levels
- Upgrade of old control HVAC controls to modern direct digital controls
- Replacement of old HVAC units with high efficiency HVAC units
- Ongoing monitoring based commissioning program
- Use of more efficient (energy valves) control valves for the control of building heating and cooling coils

Based on a long term energy use reduction of 35% in building energy usage using such projects, Table 2 presents an estimate of reduction in GHG emissions based on energy efficiency improvements.

	Reduction
Assumption: Building electricity use reduction target (%) through lighting and HVAC improvements	35%
Heating use reduction through improved HVAC system operation	35%
Base Line Base Case Electricity use (kWh)	5,791,581
Base Case Gas use Therms (Excluding cooling related)	171,516
Reductions GHG Reduction due to Building electricity conservation (lbs)	3,737,539
GHG Reduction due to Building Heating system energy efficiency (lbs)	2,004,832
Total Efficiency Related GHG Reduction (Metric Tons)	2,605
Impact Most recent GHG Emissions Inventory (Metric Tons)	10,068
% Reduction due to Energy Efficiency campuswide	26%

TABLE 2. ESTIMATED IMPACT OF ENERGY EFFICIENCY ON GHG EMISSIONS

C. IMPACT OF MASTER PLAN LOAD GROWTH- CORE CAMPUS

As energy standards become increasingly more stringent, there is reason to believe that new buildings developed over the next 20-years would be significantly more efficient than the buildings currently in operation. Table-4 estimates the energy use impact associated with new core campus buildings proposed under the Master Plan. Shown are impacts of both core campus growth and removals of the existing Pubelo Dominguez housing associated with the future development of the LDP area. Table 3 presents the extent of PV capacity required on campus to offset the net increases in GHG emissions and sustain the overall GHG carbon footprint to 1990 levels. Estimates show that an estimate 7.2 MW of PV, together with the 35% energy efficiency improvements, can help sustain the overall GHG footprint

D. IMPACT OF MASTER PLAN LOAD GROWTH- LDP AREA

While LDP area buildings are situated on campus property, it is assumed for the purposes of the analysis presented herein that the GHG emissions associated with the LDP buildings would not count towards the campus GHG footprint. Accordingly, all emission estimates and discussion and findings related to achieving compliance with AB32 GHG emission levels are limited to the core area campus buildings only.

Item	Value
Baseline GHG Emissions (Metric Tons)	10,068
Master Plan Related Load Growth (Metric Tons)	4,161
SUM OF Existing and MP Related Additions	14,228
Reduction From use of All Electric Chiller (Metric Tons)	2,002

Technology and Communication (Appendix B.3 to
Master Plan Guidelines 2018)**

B.3: PES Electrical Infrastructure/Information Technology and Communication

The **University Village** is an urban design concept within the CSUDH 2018 Master Plan that integrates the academic core and the student residential community with a neighborhood of retail and business communities and residential apartments to create a live/work/play environment with synergistic connections to the University's mission and purpose. The **Land Development Project** (LDP) is a privately-financed and developed mixed-use project on 76.5 acres within the University Village that includes high-quality rental housing for faculty, staff and community members; retail development; and business park development. It is anticipated that the LDP would be developed as a public-private partnership (P3) which could be constructed over a period of years. Student Residence Halls (Parcels 2A and 2B) and Student Apartments (Parcel 3A) are part of the University Village, but are not currently envisioned as part of the LDP P3 land development.

Unless otherwise noted, the analyses and reports produced for this Appendix include all the parcels of the University Village and are not confined to the parcels of the Land Development Project.

ELECTRICAL INFRASTRUCTURE HIGHLIGHTS

PART-A : CORE CAMPUS

Core Area: 1.7 million GSF

Long Term 12kV Power Capacity:
 20,000 MVA

Strategy: Construct a new SCE service substation with a campus-owned transformer rated up to 20,000 kVA. Install a new 12kV, 1200A or 2000A main service switchgear with 8 new feeder breakers. Reconnect the existing Central Plant switchgear to the new service. Install two new 12kV loop feeders to supply a total of four 12kV loops. Rearrange and upgrade the campus 12kV infrastructure to create four areas to match the loop feeder capacity.

PART-B : LDP

LDP Parking Area: 1.9 million GSF
 LDP Building Area: 3.8 million GSF

Long Term 16.5kV Power Capacity:
 25 kV

Strategy: The LDP will consist of residential, commercial, retail, parking, and office occupancies. Most of the occupancies will be third party operated, and separately metered. The LDP area load cannot be supplied by the new SCE Core Campus Substation. A separate SCE service substation with SCE operated and maintained distribution system is required. The LDP Authority has the option to own and operate the 12kV system. SCE operated distribution is preferred. The distribution system would have four SCE 16.5kV dedicated distribution system circuits, with each loop capable of supplying the entire load it serves from one or both feeders. Outdoor padmount sectionalizing switches and padmount transformers will supply the individual building parcels.

PART A: CAMPUS 12KV POWER INFRASTRUCTURE

A. EXISTING CONDITIONS

The core campus utility electrical service is provided by SCE and consists of two 16.5kV overhead distribution feeders configured in a preferred-emergency (PE) automatic transfer switch (ATS) configuration that was common at that time the service was originally installed. The second SCE 16.5kV service feeder was referred to as “emergency” which meant it was to be used as a backup in the event the “preferred” feeder was unavailable. However, in the event of a total loss of the utility distribution system power, no power is available. CSUDH leases the 16.5kV outdoor PE service switchgear from SCE. The substation was installed by SCE and included SCE metering, station power, and two 16.5kV - 12kV, 5,000/6,250kVA transformers with low resistance grounded neutral. The campus SCE 16.5kV - 12kV service equipment is 47 years old. The two SCE transformers are shown in project records to be askarel-filled (PCB). The campus peak load is approximately 3323kVA, which is roughly 3.3Watts/GSF.

The SCE service entrance cable is single conductor 500kcmil, 25kV rated cable and capable of carrying 450A continuously, which is equivalent to 9.4MVA. The SCE underground cable is the determining limiting factor for the existing campus service capacity. SCE needs to be consulted to establish the capacity limit of

the existing 16.5kV service. The 16.5kV-12kV service capacity for a single transformer is 5MVA/6.25MVA. The peak load today is near 3.32MVA. The campus load is roughly 66% of the single transformer service capacity. Several new projects will result in an increase in the peak demand.

The CSUDH Central Plant 12kV switchgear campus feeders include HV-1 and HV-2, HV-5 and HV-6. The feeders are paired with one feeder from each side of the main service switchgear tie-breaker to form a 12kV loop distribution system. The original campus main 12kV switchgear was replaced circa 2004, along with sectionalizing switches (new SF6 switches). The two paired loop feeders are 250kcmil with an ampacity of 310A and are installed from Central Plant to the buildings on campus. However, the loop feeder conductor is reduced to #2AWG, Cu along its path limiting the loop to 130A. Feeders HV-1 and HV-2 supply power to the west part of the main campus, while feeders HV-5 and HV-6 supply power to the east side of campus with the dividing line being the main north-south pedestrian mall. Each loop is capable of supplying up to 6400kVA of load from a single feeder breaker, if the entire loop consisted of 250kcmil cable. The #2AWG limits the loop capacity to 2700kVA.

In addition to the SCE Central Plant 12kV service, the campus has three other SCE services. The Physical Plant, Student Housing 1, and illuminated Campus Sign at Avalon and Victoria are all served by SCE at 480V or 208V.

B. SYSTEM CHANGES UNDERWAY (APRIL 2017)

The core campus is supplied power from SCE at 16.5kV via two overhead distribution circuits and two underground service laterals that terminate at the Central Plant 16.5kV service entrance PE ATS switchgear. The two SCE 16.5kV circuits are supplied from two different SCE distribution substations. Each SCE circuit is capable of supplying the entire campus load with an ultimate limit of approximately 9400kVA. The existing SCE PE ATS service switchgear is leased from SCE. The lease expires in late 2017. SCE has been requested to provide options regarding lease renewal or replacement.

A new 1,000kW Battery Storage System will be installed and operational in 2017. The Battery Storage System will be connected to existing switch CP-CPHV5 with a 250kcmil feeder conductor size. The Battery Storage System will be controlled by STEM, who will operate the battery system to reduce electric power peak demand by 1000kW for up to 4-hours. The operation of the battery system is controlled by SCE and at other times as determined by STEM, under the agreement between STEM, SCE, and the University.

The new 12kV, 250kcmil feeder installed for the Battery Storage System will also be used to supply power to the new electric chiller installation. A 3750kVA, 12kV – 480V transformer will be installed to supply a total of three new 800-Ton electric chillers and associated pumps that are planned for installation. Construction for the new chiller installation will

begin in June of 2017. A second transformer rated 2000kVA will be required to supply two additional 800-Ton chillers in the future. The electric chiller and battery system project designs must be closely coordinated.

The new cooling tower replacement project will be completed in 2017. The new cooling tower replacement project will be supplied 480V power from the existing Central Plant 12kV unit substation, CPT1 and CPT2. This new project will result in a net increase in load when all three cooling tower cells are in operation.

The new 75,000GSF Science Building will begin construction in 2017. The existing 12kV source feeder for the SAC buildings is connected to switch CP-CPHV5 and is sized to #2AWG, Cu. The cable installed from CP-CPHV5 will be removed. Two (2) new 250kcmil feeders will be installed from NSM-201HV1 and NSM-201HV2 to a new four-way SF6 switch. The new Science Building and CMS Buildings will be supplied from the new SF6 switch. The Science Building will result in an estimated

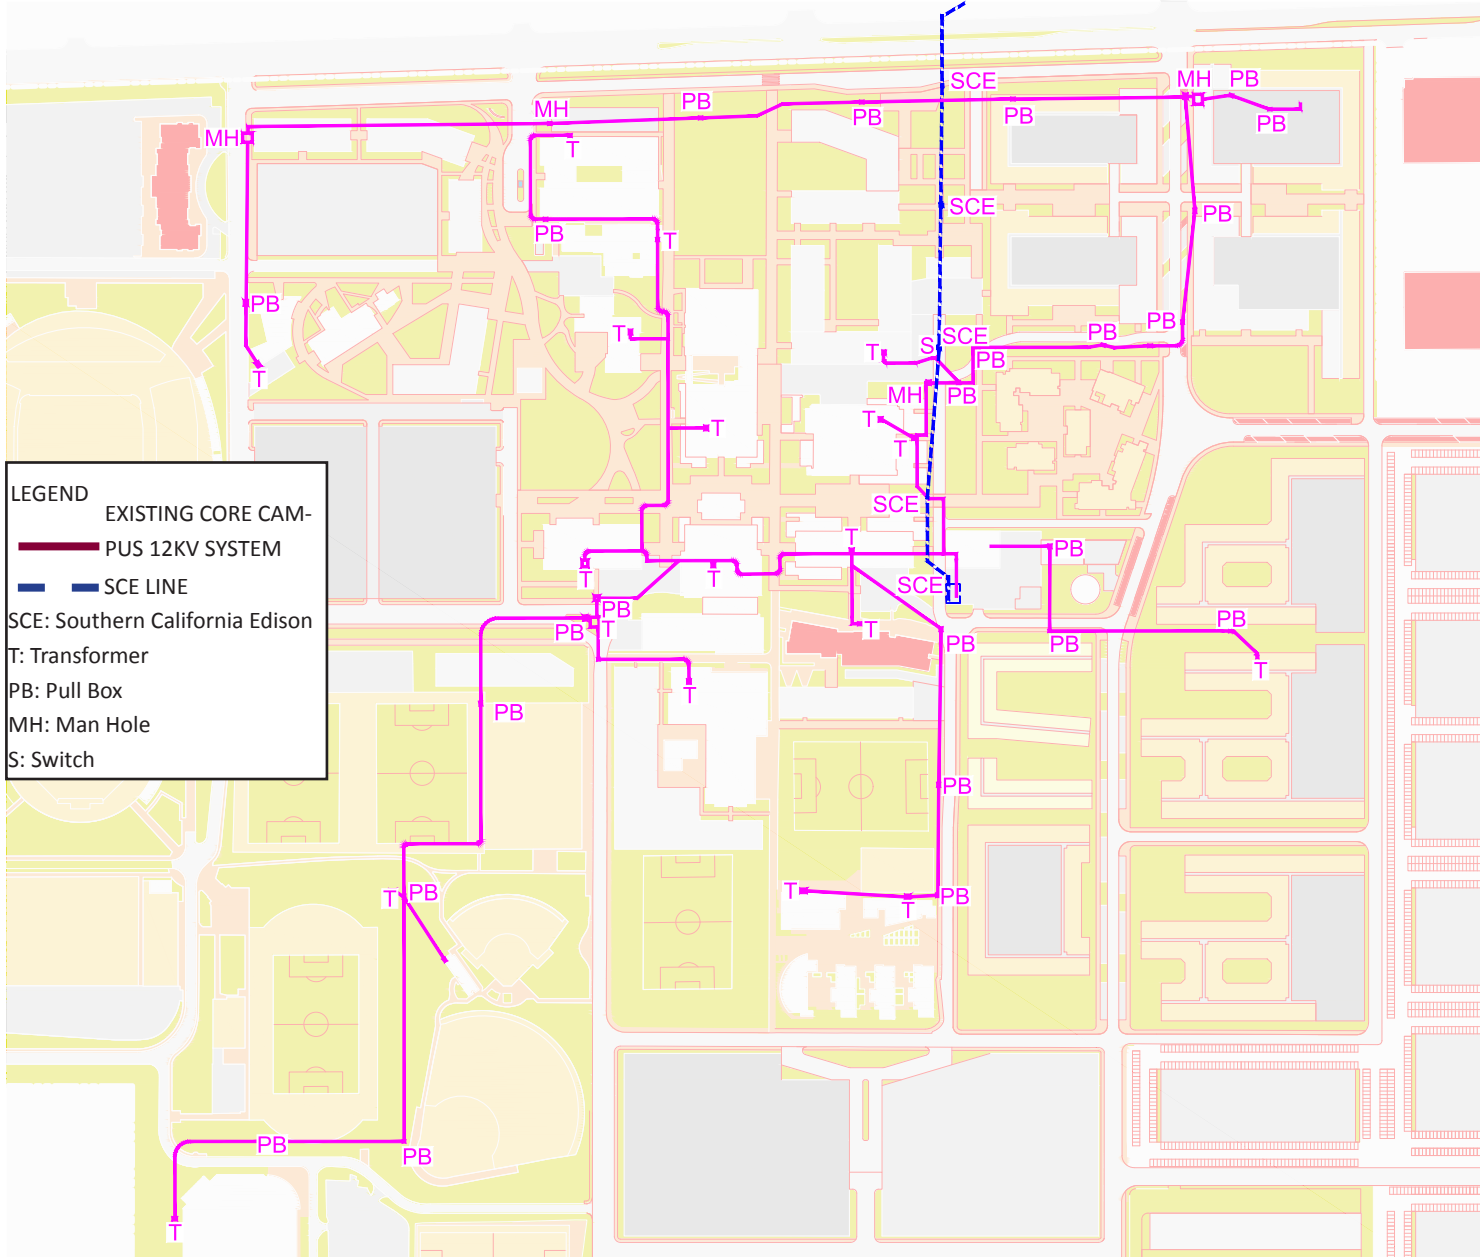

FIGURE 2. EXISTING CORE CAMPUS 12KV SYSTEM

net increase of up to 425kVA based on 5W/sqft. SAC 100 is being demolished as part of the Science Building project and will result in a decrease of 100kVA or so.

The Student Housing Phase III project is in conceptual design phase and occupancy is planned for the Fall 2019 term. The project may or may not include cooling for the dorm rooms. A 1,000kVA, 12kV-208Y/120V loop feed transformer will be installed and connected to SBS 100 HV5 or SBS 100 HV6. The new load is estimated at 4W/sqft, 390kW. This excludes cooling loads.

C. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

Table 2 summarizes the buildings being considered for development as part of the Master Plan. Table 2 shows the Core Campus buildings, GSF, kW demand per sqft, and estimated peak demand. Table 2 also includes peak demand if rooftop PV is installed. A new electric service is required to supply the total load. The existing service transformers cannot supply the total load, and the space where the existing service equipment is installed is not adequate for the new larger transformers. Construction dates have been assigned to new buildings in order to prepare a load growth estimate. Based on the estimate, a new campus service is required sometime between 2023 and 2025, if planned construction is completed according to the dates assigned. The load forecast should be updated when actual planned construction dates become available.

The LDP electric load cannot be supplied from the existing or new electric service for the Core Campus if the SCE service voltage remains 16.5kV. The alternative to 16.5kV service is 66kV, which requires a larger substation area (115' x 160'), and major upfront investment.

Based on the addition of up to 1.4 million GSF of new buildings, net of any existing building load to be demolished, the long term electric power coincident peak demand to be supplied to campus load is estimated at 19,750kW, or 21,944kVA.

The building electric power load diversity will typically result in a lower actual peak demand than is estimated. The non-coincident peak demand is estimated at 15,800kW using a factor of 0.8 to account for load variability. The estimates for W/GSF included in this study are based on empirical “real world” values for the local climate zone, and are adjusted. It is important to err on the conservative side when determining the “minimum” electric power service and distribution feeder size requirements because the planned infrastructure must support the next 40 years of campus operations and construction. The “extra” capacity provided as a result of the more conservative approach will allow for flexibility in design and future load growth. The new service should be designed and rated to allow for at least 40 years of load growth and changes.

One component of the new load is electric vehicle charging station loads. A typical Level 2 charger consumes 8kVA for 3-4 hours to fully charge a vehicle battery. Fast chargers

presently consume 60kVA of power for 1-2 hours. The California Building Code, California Energy Code, and California Green Building Code all include requirements for residential and non-residential electric vehicle supply equipment (EVSE). A total of 6% of all new parking spaces must be designated as EVSE and include provisions for the electrical system capacity to install EVSE charging systems. The percentage of EVSE compliant parking spaces required has recently increased from 3% to 6%, which translates to a very large increase in electric power demand and capacity. This is a very good example of future load growth that did not exist 5-years ago. The load estimates for parking structures in this study include up to 10% of all spaces as EVSE equipped. This exceeds the 6% mandatory requirement, but is deemed prudent given the rapid growth in EV use and demand. Future development in commuter transportation options, including ride sharing and autonomous vehicles, as well as bi-directional vehicle charging equipment require designers to prepare for flexibility in their electrical system designs.

The load estimate in Table 2 and Table 3 includes a reduction in daytime peak demand due to photovoltaic (PV) produced power. Refer to Appendix 4 for details regarding the Photovoltaic Concept for the Core Campus.

D. MEETING LONG TERM ELECTRIC POWER LOADS WITHIN THE CORE CAMPUS

The existing campus electric service is 47-years old. The original design and capacity included two 5000kVA transformers, each one capable of supplying the entire campus load. The 12kV distribution system includes a 1200A main-tie-main switchgear and two separate 12kV loop feed distribution feeders. The design provides a high level of reliability that should be maintained as the system is renovated and new loads are added. The future development and expansion of the Core Campus electric infrastructure envisioned in this study maintains and expands upon the original design approach. A potential scenario to accommodate the increase in campus electric power capacity is summarized below.

1) Continue to utilize the existing SCE service and establish the maximum existing service capacity. Begin planning for a new higher capacity substation with SCE. The ultimate capacity of the new substation should be on the order of 20,000kVA. Establish the schedule to construct and energize the new service substation based on the timing for construction and energization of new Core Campus loads and SCE requirements for planning and construction. Given the information available regarding plans for new facilities, a new substation may be required by 2023-2025. Planning, design, and funding should start immediately. SCE will require up to 4-years to plan, construct, and energize. The new Campus Core substation design must be coor

TABLE 3. ALL BUILDINGS SERVED BY CORE CAMPUS, FINAL PLAN

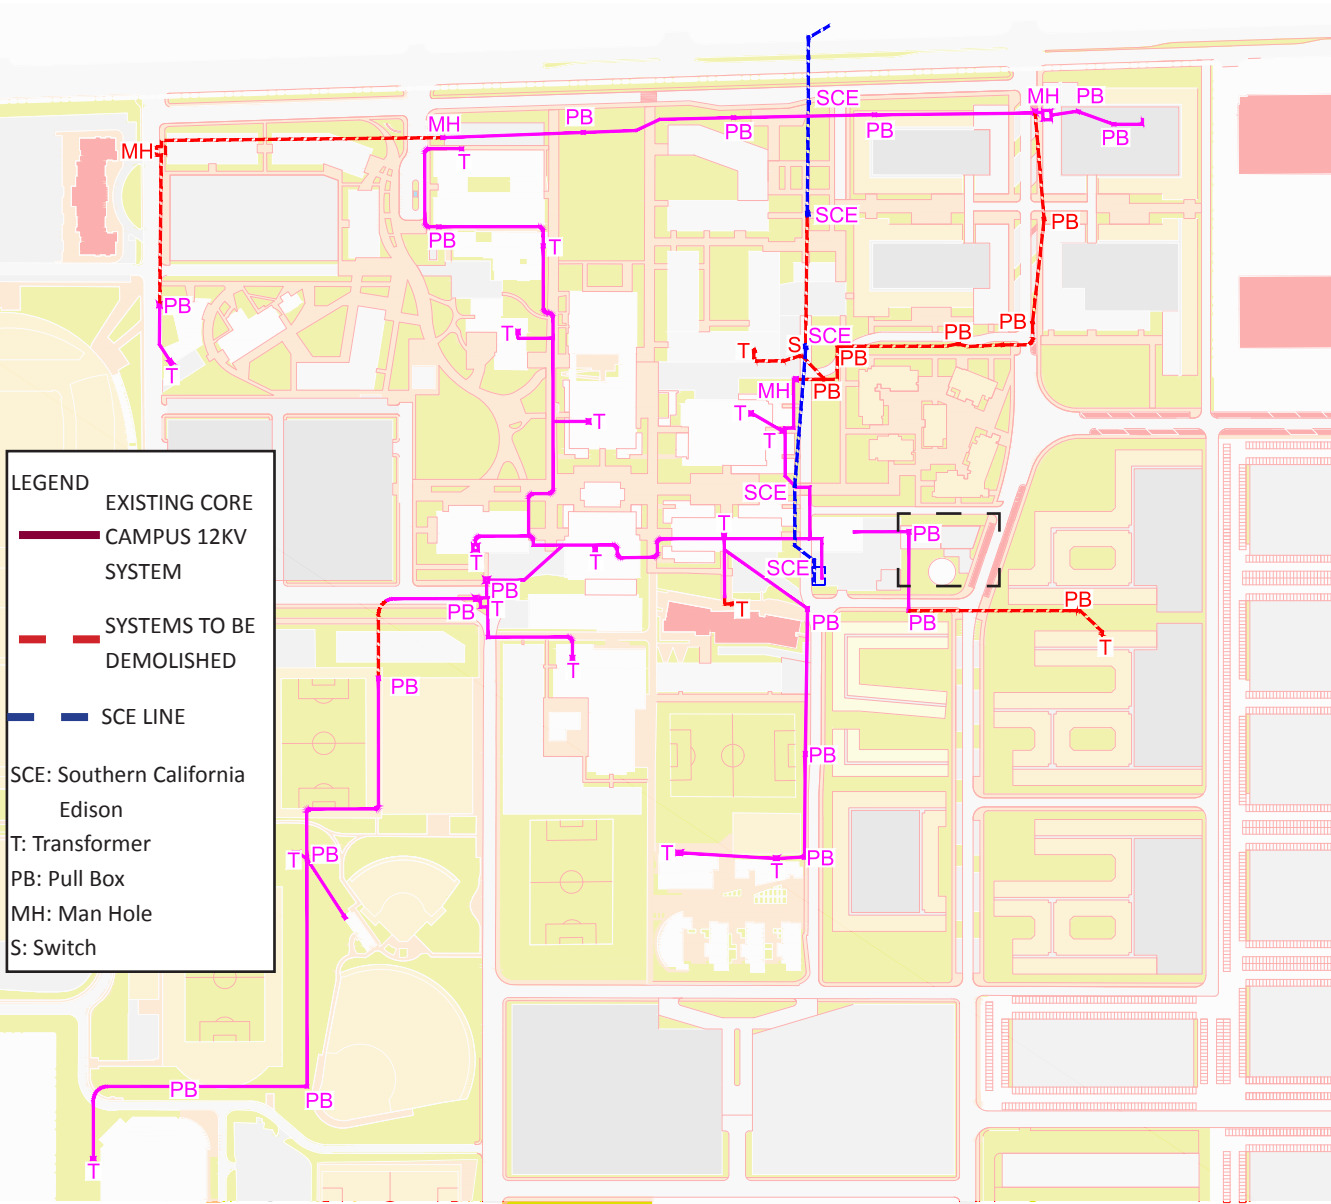

FIGURE 3. EXISTING 12KV POWER DISTRIBUTION LAYOUT, DEMO PLAN

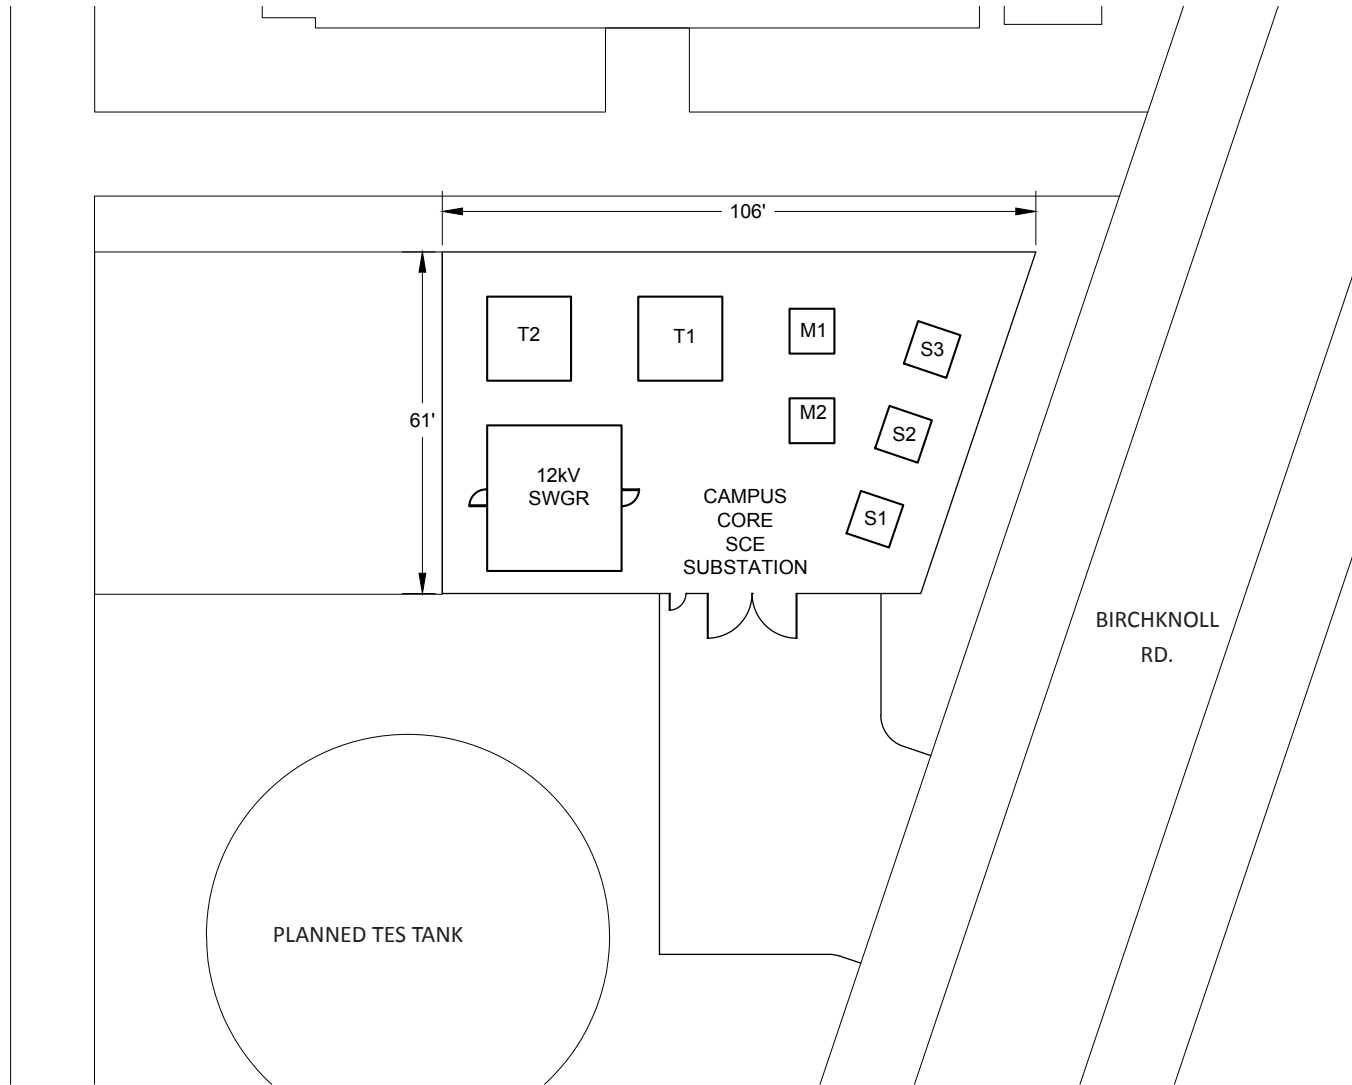

FIGURE 4. SCE NEW SUBSTATION

minated with the SCE design and planning for the LDP area.

2) Provide new feeders, sized at 250kcmil minimum, for the new Science Building, new Student Housing complex, and new Chiller Plant. The 250kcmil conductor size is a minimum size for a loop feeder.

3) As load increases, and until a new Core Campus substation is energized, rebalance the loads between the two 12kV 5000kVA transformers and main breakers to avoid an overload of either 5000kVA transformer. Install meters to continuously monitor the load at the main 12kV switchgear. Establish the maximum load SCE can provide from the existing service.

4) Monitor the 12kV feeder loads. Rebalance the feeders by switching building loads between the 12kV feeders to avoid an overload of an individual feeder. Install meters to continuously monitor the feeder loads. Replace the existing @2AWG loop feed cables with 250kcmil.

5) The new SCE Core Campus substation will be located northeast of the proposed new TES tank. A concept design for the new substation is shown in Figure 3. The final design must include SCE requirements. The new substation will include SCE 16.5kV distribution equipment maintained and operated by SCE. The substation will also include campus owned transformers and 12kV switchgear. The maximum capacity of the substation should be 20,000kVA, based on the Master Plan load estimate. The load estimate basis excludes the mitigating effects of campus installed generation, such as PV or fuel cells, and also energy storage, such as batteries, which will reduce the peak load when in operation. SCE will need to confirm the ultimate capacity available for the new substation. The new substation will include Rule 21 provisions for customer owned generation.

6) The new 12kV distribution system will consist of four loop feed circuits, requiring eight total feeders. Two existing loop feeders with 250kcmil cable will need to be upgraded overtime to replace some #2AWG cable in order to provide 310A, or 6400kVA, of full capacity of the loop. The existing loop feeder will also need to have some existing switches replaced in order to address configuration issues in the future. Two new loop feeders will also be required to supply the new loads. One of the new loop feeders can be connected at the existing 12kV main switchgear using spare breakers HV3 and HV4. The other new loop feeder will be connected to the new 12kV substation switchgear. The existing 12kV main switchgear located in the Central Plant will be reconnected and supplied from the new service with parallel phase conductors capable of supplying 1200A continuously. The two new loop feeder circuits should be 500kcmil cable to provide for future load growth and back-up feeder capability to cross connect to the two existing 250kcmil feeders. The cross connect capability will be utilized during modification of the infrastructure, when sections of existing duct bank are removed as part of demolition for site preparation. Power system studies will be required and existing equipment short circuit interrupting

ratings will need to be checked versus the new higher short circuit duty. The existing SCE service equipment will be demolished after the new substation is energized with the Core Campus loads.

7) Include electric power infrastructure costs for demolition and replacement in the cost for each building project. The costs should include all duct banks, manholes, loop feed cable, 12kV sectionalizing switches, and building service cable and transformers that are associated with the work necessary to maintain continuity of service to existing campus loads, connect new buildings and loop feeders, and make provisions for the ultimate system configuration. This will add significant costs to each project, so project feasibility studies should include scope and costs for infrastructure installation and replacement.

8) Meet with SCE to define Rule 21 requirements and the location for a Utility Line Disconnect (ULD) for all utility interactive inverters associated with energy sources that operate in parallel with the utility. It is preferred to have a ULD at each location where an inverter is installed rather than have the campus main service designated as the ULD.

9) The campus should review the requirements for electric vehicle supply equipment (EVSE) and establish compliance objectives. The 6% mandatory requirement established by the California Codes and Regulations is applicable to all new parking lots and parking structures. The total power capacity required to supply 6% of the 8,584, or so, new parking spaces, or 515 EVSE required spaces, is 4,120kVA. This is roughly 25% of the estimated peak demand for the new construction included in the Master Plan.

10) Develop a phasing plan, budget cost estimate, and a capital project request for each phase of construction for new infrastructure and new campus SCE service substation.

11) Graph 1 and Graph 2 depict the Core Campus peak load profile. Graph 1 is the Core Campus load without PV, and Graph 2 is the Core Campus load with PV. The peak load reduction due to battery operation is also shown.

GRAPH 1. CSUDH CORE CAMPUS LOAD PROFILE WITHOUT PV

GRAPH 2.CSUDH CORE CAMPUS LOAD PROFILE WITH PV

PART B: LDP AREA ELECTRIC POWER INFRASTRUCTURE

A. LOAD GROWTH ASSOCIATED WITH MASTER PLAN

The LDP area is subdivided into building parcels that will be developed over a 15-year time period. The planned development of the LDP is very dense consisting of 1.7 million GSF of parking structures, 2.5 million GSF of multi-family residential units, 94,000 GSF of retail, 690,000 GSF of apartments, and 591,000 GSF of business park buildings. Table 4 includes the estimated electric power demand associated with each parcel with and without photovoltaics. The total estimated peak load for the LDP area is 23,195kVA without photovoltaic power considered. Electric vehicle EVSE loads will add another 4,900kVA of power demand. Graph 3 and Graph 4 show the load profile for the LDP with and without photovoltaic power. Provisions for photovoltaic power are now included in the Title 24 Energy Code, however, the amount of PV that could be installed is variable.

B. ELECTRIC POWER SERVICE OPTIONS FOR THE LDP AREA

Electric power for the LDP area development can be provided in several ways as follows:

- 1) Supply power from a new upgraded SCE substation that also supplies power to the Core Campus with the infrastructure owned and operated by the campus. A consolidated single substation would require 66kV service and a 115' x 160' substation. Rule 18 compliant metering would be required.
- 2) Supply power to all LDP parcels from an SCE operated and maintained underground 16.5kV distribution system, with up to four 16.5kV circuits configured in two loops.
- 3) Supply power to LDP area loads from a combination of new SCE Core Campus substation and campus infrastructure and new SCE operated and maintained infrastructure. The capacity of the new SCE Core Campus substation is limited and could not accommodate the LDP loads.

There are several issues to consider with the three options for supplying power to the LDP area.

- 4) The existing campus Phase 1 Housing project and existing Operations Buildings are presently located in the LDP area and are supplied from separate SCE services. Both of these occupancies will ultimately be demolished, however the precedence for SCE service of the LDP area of the

campus is important because it establishes an SCE presence on campus, which is covered under California Public Utilities Commission (CPUC) Rule 16 for line extensions on private property. SCE has the option to install, operate, maintain, and meter such line extensions and provide service equipment to customer owned occupancies requiring multiple meters. SCE is also providing power to a privately owned parcel located on the northeast corner of the LDP area that is supplied from the same distribution circuit that supplies the Phase 1 Housing. This SCE underground feeder may require relocation based on the proposed development and building plans for the LDP.

5) The new SCE substation required for the Core Campus will be supplied from SCE 16.5kV distribution circuits. A dedicated distribution circuit capacity limit for a 16.5kV circuit is roughly 17,000kVA. Based on the load forecast for the Core Campus, there is no spare or excess capacity to supply LDP area loads. A new 66kV service would be required to supply both the Core Campus and the LDP areas. The advantage of a 66kV service is that there is a 20% energy cost savings. The disadvantage is the higher first cost and SCE Added Facilities charges. SCE would need to prepare a Method of Service Study for both 16.5kV and 66kV service options to better inform the options, costs, design, and construction schedules.

6) An underground 16.5kV distribution system that is operated and maintained by SCE is feasible. The site plan shown in Figure 5 is based on SCE operated and maintained service. There are many advantages to this approach including:

a. The cost for SCE cable and equipment is largely offset by new service credits, which will reduce the project first costs.

b. Individual occupancies can be separately metered by SCE reducing the cost and burden for campus installed metering systems and costs for accounting, billing, customer relations, and collections.

c. The campus avoids the first cost for installation of cable and equipment, maintenance and operations, metering systems and billing, trouble calls, etc.

7) CPUC Rule 18, Part E requires all separate premises to be individually metered. A customer is prohibited from the re-sale of electric energy, unless a utility grade metering system is installed. However, none of the costs associated with metering and billing can be charged to the end user. For the LDP, maintenance of a campus owned metering system would be a significant cost for both labor and operations and on-going financial burden. For this reason, an SCE operated and maintained distribution system with SCE meters is recommended.

8) The site distribution plan shown in Figure 5 is relevant and applicable to either an SCE operated system or a campus operated system. The main considerations are:

a. First Cost. The customer is responsible to install underground structures. The developer or the campus must pay for duct banks, manholes, and equipment pads, regardless if SCE or campus operated. The overall first cost including cable and equipment is lower if SCE service credits for new load can be applied.

b. 66kV vs. 16.5kV. SCE will need to complete a Method of Service Study in order to provide a cost estimate and schedule for service options. A location for a 66kV substation would need to be identified and would likely be near a major thoroughfare in order to reduce 66kV construction costs. The campus should initiate discussions with SCE as soon as possible to begin a Method of Service Study for both the Core Campus and LDP. SCE will charge a significant upfront fee for the MOS.

c. Metering. The LDP area will include thousands of occupancies. How are those occupancies to

be metered and charged for energy use? Installation of meters by SCE is the better option for many reasons.

Parcel	Building Name	GSF	Watts/SF	Peak Load (kW)	PV Peak Capacity (kW)	Net Peak Load with PV (kW)	Peak Load (kVA)	Net Peak Load with PV (kVA)	Year Energized

TABLE 4. LDP AREA LOAD FORECAST WITH AND WITHOUT PHOTOVOLTAIC POWER

C. EXISTING 12KV POWER DEMOLITION AND RELOCATION

The Core Campus HV-6 12kV loop feeder is connected from the SBS Building to Vault 2 and then to Vault 3 through a duct bank and series of manholes and pull boxes that cross the LDP area. The ductbank supplies power to VDC Substation #2 and the Childhood Development Center (CDC) and Infant Toddler Center (ITC) as well as Parking Lot 1 photovoltaic installation. The 12kV source to the CDC and ITC will need to be modified since it will be demolished during development.

The Student Housing SH-1 SCE 12kV source duct bank also supplies power to the commercial buildings located at the northeast corner by Central Avenue and Victoria Street. LDP development will need to be coordinated with the existing SCE underground circuit. The Student Housing SH-2 is supplied from the campus 12kV via Central Plant. The duct bank and equipment associated with SH-2 will be demolished.

The Facilities Services (FS) complex is supplied power by SCE at 480V. The SCE service will be demolished when the FS building is vacated.

IT INFRASTRUCTURE HIGHLIGHTS

PART-A: CORE CAMPUS

Core Area: 1.7 million GSF

Strategy: Work with service providers to enhance data and internet bandwidth and data transmission speeds. Upgrade the Core servers and switches. Install two separate cables to each building via different paths for redundancy. Provide increased backup power capacity to the Data Center and Campus network servers and switches. Enhance reliability and bandwidth for additional services by installing additional GigaMAN services to separate new MPOE locations.

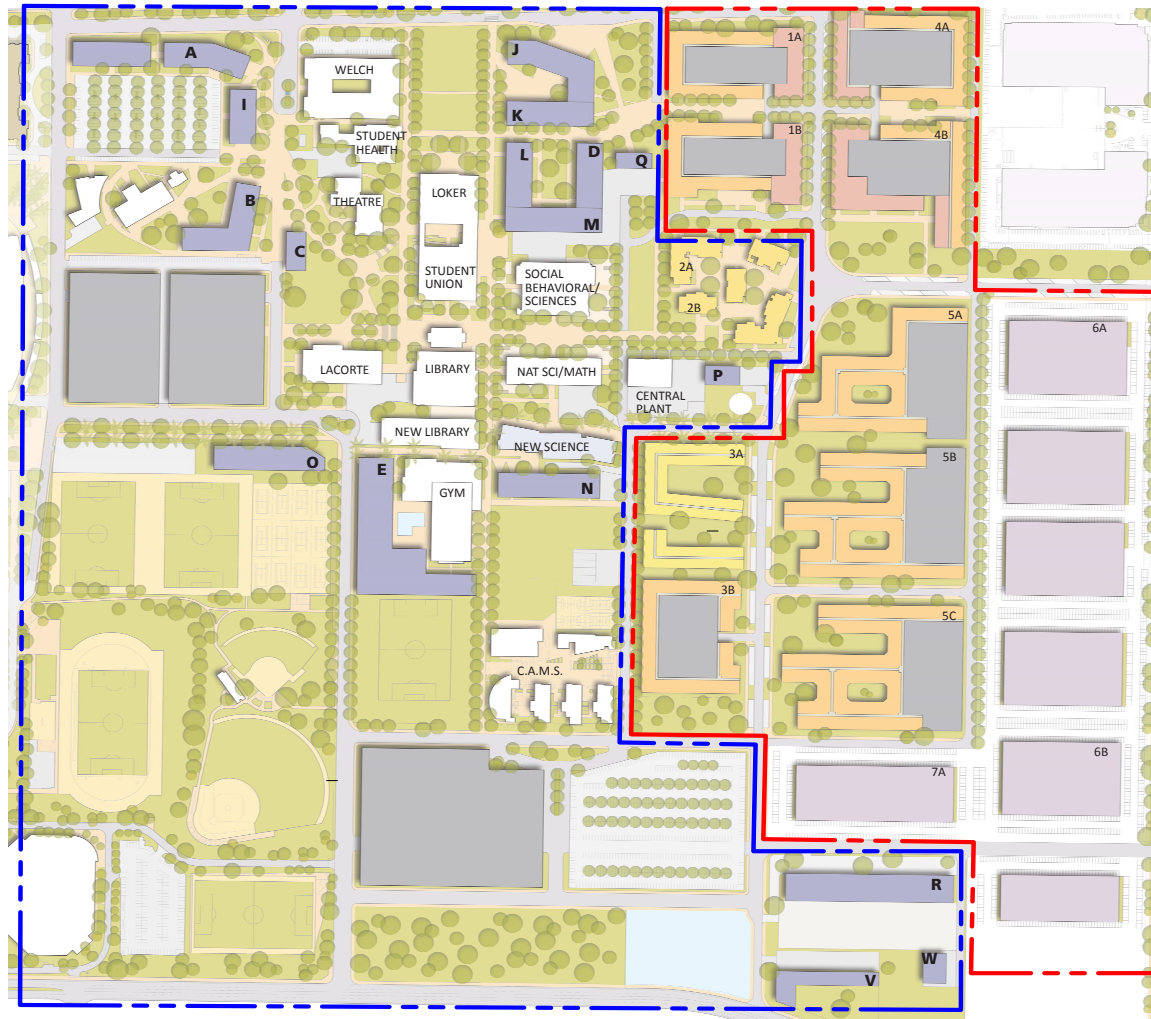

FIGURE 1. HIGHLIGHTS OF CAMPUS MASTER PLAN IT INFRASTRUCTURE

PART-B: LDP

LDP Parking Area: 1.9 million GSF

LDP Building Area: 3.8 million GSF

Strategy: The LDP will consist of residential, commercial, retail, parking, and office occupancies. Most of the occupancies will be third party operated, and separately metered. The LDP will be connected to the Core Campus via fiber optic cable or through Virtual Private Network (VPN) access. Data and internet service should also be provided by third party entities. A joint infrastructure will be utilized to deliver IT services to all occupants. The campus can provide cloud services for academic, incubator and residents. Separate Wifi networks will be needed.

PART A: CORE CAMPUS IT INFRASTRUCTURE

A. EXISTING SYSTEMS

The campus has three Primary Rate Interface (PRI) lines that provide a total of 72 trunks for external local telephone calls and two T1 lines that provide a total of 48 lines for external long distance telephone calls. The PRIs and T1 lines are provided from a variety of service providers including MCI, ATT and others. The PRI lines are routed via overhead fiber optic utility lines that enter at the north of campus and are routed underground down to the Main Point of Entry (MPOE) located in the ERC Library Building. The PRI lines terminate at the Intecom E PBX now supported by Mitel/Aastra. The Aastra PBX was installed in 1996. The campus has been converting the telephone service to a cloud based Voiceover IP (VoIP) system since 2014.

Figure 2 shows the campus IT infrastructure of the existing data/telecom systems infrastructure and the relative position of key points of service at campus buildings. The cabling installed in the utility tunnel is not shown.

The campus has redundant network service utilities that have divergent paths onto campus from different source connections. The network service is provided by CENIC over AT&T GigaMan fiber optic cable. The service provides connectivity with 1 GB of bandwidth.

The primary network service enters campus from Victoria Street north of the SCC-1 building and is routed underground to the MPOE located in the ERC Library Building. The backup network service enters campus east of the Child Development Center and is routed underground before terminating at its MPOE located in the Welch Hall Building. The backup service remains inactive and only becomes active when the primary service fails. During a primary service failure, external internet traffic is automatically re-routed to the backup service.

The campus has two MPOE locations. One MPOE is located on the first floor of the ERC Library Building. This MPOE houses the telephone equipment, including the PBX, and the primary network service equipment. The equipment located in the ERC Library Building MPOE is provided with a variety of rack mounted Uninterruptible Power Supplies (UPS) or battery backups that are supplied power from a backup generator during a utility power failure.

The second MPOE is located on the third floor of the Welch Hall Building within the Campus Main Data Center and houses the backup network service equipment. The networking equipment and Data Center servers are connected to a variety of rack mounted UPS units which are backed up by a backup generator. The Data Center houses the campus computer network servers.

The network services installed in the ERC Library and Welch Hall MPOEs are connected together via fiber optic cabling. The fiber optic

cabling is installed in underground pathways and the utility tunnel between the two buildings.

Telephone service for all campus buildings are networked back to the primary MPOE located in the Library Building over copper lines that were originally installed to provide all telecommunication services to the buildings. Since 2014, buildings telecommunication services have been migrated to fiber optic cables to provide VoIP service to the buildings. The building Main Distribution Frame (MDF) and Intermediate Distribution Frame (IDF) rooms have been equipped with VoIP POE switches to connect VoIP handsets to a cloud based VoIP utilizing broadband internet access. The copper and fiber optic cables are routed mostly in underground ductbanks that connect between the Library Building MPOE and rest of the campus buildings.

Internet and internal networks are routed through the fiber optic network cables to the ERC Library Building MPOE. Network routers and switches are used to route the network traffic to the internal servers or to the internet as required.

The campus has multiple utility cables that provide the telephone service. Redundancy is provided over the multiple utility cables for telephone service. Though, the utility cables provide redundancy, a failure in the cable would result in a reduction of the system capacity. The PBX System is not provided with redundancy for the telephone system. The campus has two different utility cables that provide internet service. Both the primary

and secondary utility serves are provided by CENIC over fiber optic cable. Both services are rated for a 1GBps connection. The primary and secondary service cables have divergent paths. The campus has two service routers that provide redundancy for routing the internet traffic. Each service router is associated with one of the two service connections. In the event of a service or router failure, the backup router and service will handle the networking duties.

The campus has a primary Data Center located on the 3rd Floor of Welch Hall. A backup Data Center, located in the ERC Library, provides some redundancy to the campus network services. The backup Data Center is limited to only critical services. As a result, only partial redundancy is provided. The campus has two core switches that provide network redundancy between the Data Center and each campus building due to a switch/router failure. However, each campus building is served

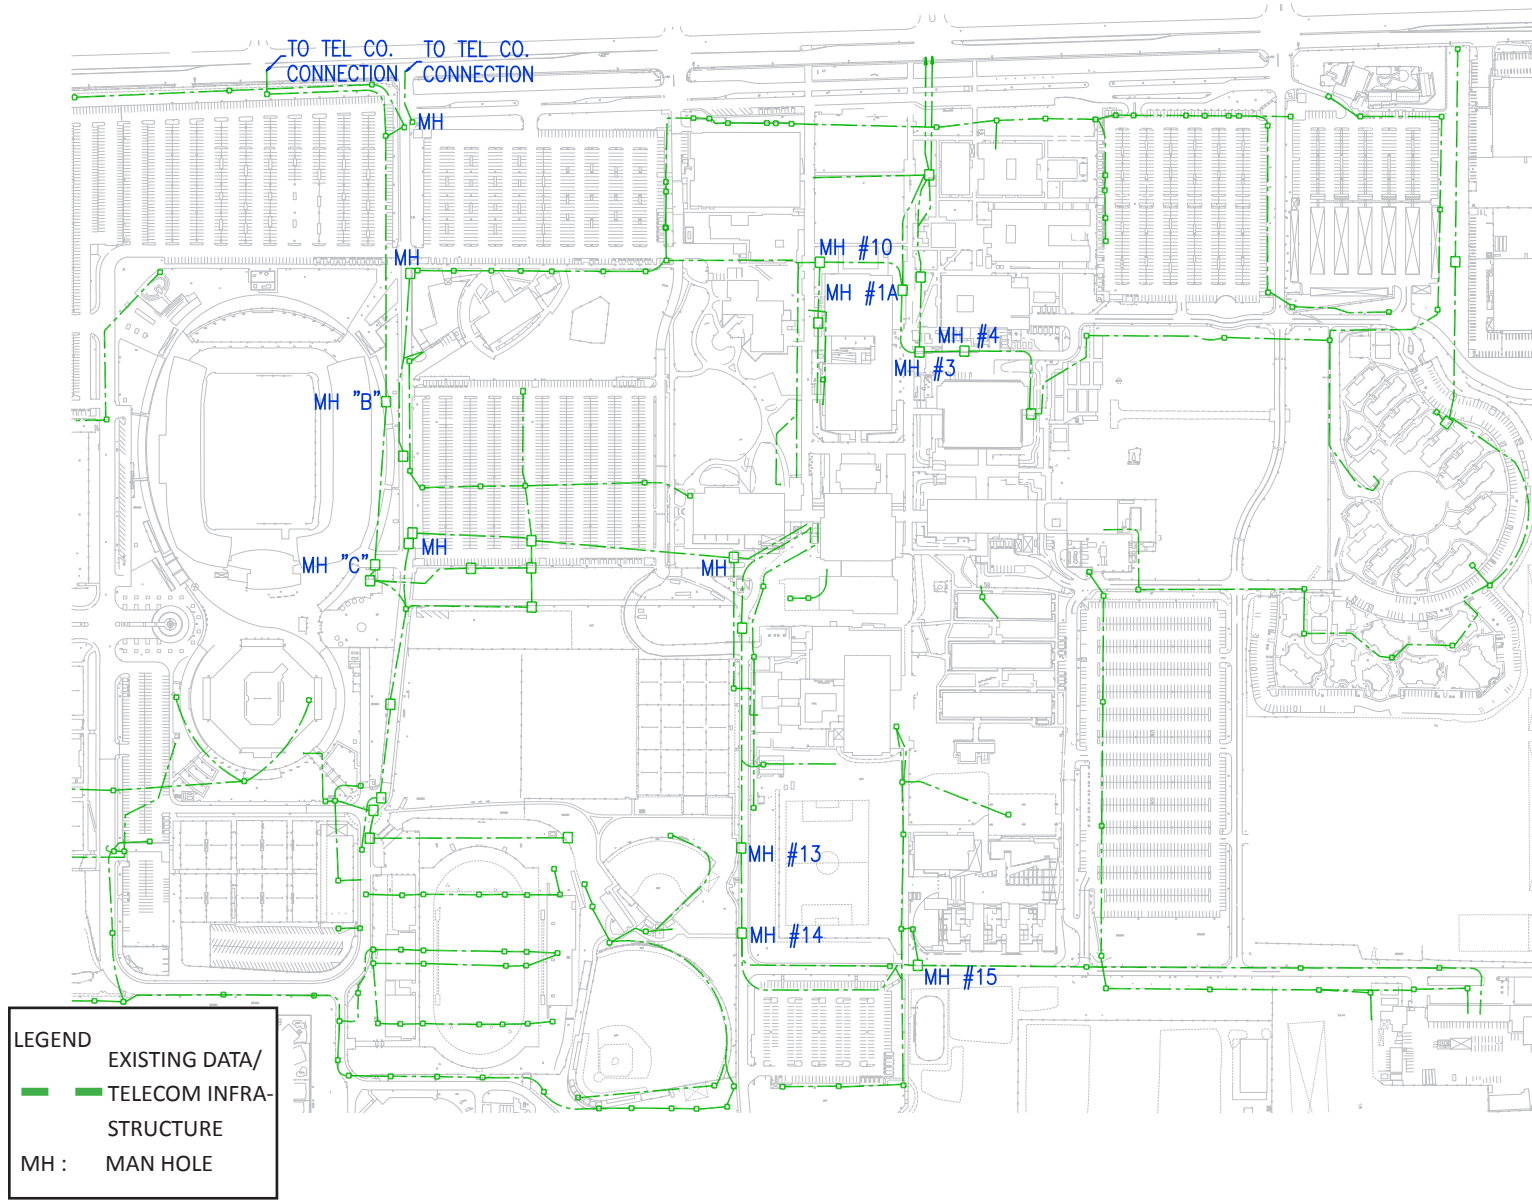

FIGURE 2. EXISTING CAMPUS DATA/TELECOM SYSTEM INFRASTRUCTURE

FIGURE 3. EXISTING CAMPUS IP NETWORK TOPOLOGY

through a single cable, providing no redundancy due to a cable failure and no alternate path to provide service in the event of a cable failure, damage to the cable, or demolition of the existing path. Figure 3 shows the existing campus IP network topology.

B. SYSTEM CHANGES UNDERWAY (APRIL 2017)

The Core Campus IT and Telephone services and building-to-building cable infrastructure is satisfactory for campus operations. The fiber optic cable installed to individual buildings lacks a redundant pathway, and both of the fiber connections are included in the same cable. Damage to the cable will result in a loss of communications with the building.

The system changes planned in the near term include:

- 1)Data Center power system upgrades to replace UPS units and power system capacity.
- 2)Connection of the new Science Building and Student Housing project.
- 3)VoIP system upgrades for individual buildings.
- 4)Installation of wireless access points for greater WIFI coverage in buildings and on campus.

C. SYSTEM USAGE GROWTH ASSOCIATED WITH MASTER PLAN

The IT infrastructure facilitates the deployment of IT services according to campus-wide needs. The existing campus IT infrastructure utilizes the utility tunnel that extends to twelve of the original campus buildings. The

infrastructure extends to outlying buildings and areas via ductbanks, pullboxes, and manholes. Many of the building connections are single radial installed cables.

All new buildings will require fiber optic cable installed from two separate pathways to the MDF of the building. Each connection should be continuous from the campus core switches. The new fiber optic cables will provide VoIP telephone service, IT service, and internet service to each building. Copper cables were traditionally installed for telephone service. The use of copper cables should be reviewed and minimized for campus-wide communications.

Refer to Figure 4 which shows the existing IT infrastructure that will be impacted by new construction.

D. MEETING LONG TERM TELECOMMUNICATIONS NEEDS OF THE CORE CAMPUS

The planned new construction will require many of the existing ductbanks, pullboxes, and cables to be removed in order to clear construction sites for buildings, parking structures, and roadways. A new IT system infrastructure is required. The new system will be designed with reference to the California State University Telecommunications Infrastructure Planning (TIP) Standards, Fourth Edition. Industry Standards, such as Building Industry Consulting Service International (BICSI), Customer Owned Outside Plant (CO-OSP) Design Manual, should also be used to establish campus requirements for campus network design.

Building ID	Building Name	GSF

L	Student Union Expansion	85,000
M	Academic/Admin	94,360
N	Academic/Admin	116,250
O	Academic/Admin	104,020
2	Student Housing 1	56,240
2	Student Housing 2	27,180
2	Student Housing 3	102,828
2	Student Housing 4	63,656
2	Student Housing 5	64,952
	New Science Building	85,000
TOTAL		1,612,926

TABLE 1. CORE CAMPUS - POTENTIAL BUILDINGS

The infrastructure should be standardized with the minimum size of manholes and pullboxes established and the minimum quantity of conduits specified. It is typical for manholes to be a minimum of 4' x 6' x 6' and for pullboxes to be 4' x 4' x 4' in dimension. Ductbanks should consist of 12-4" C for main ductbank and 4-4" C for the building service laterals.

The manholes and ductbank entries to the Core Network locations and MPOE should be increased in size. Manhole sizes and Core Network and Data Center locations should be a minimum of 8' x 10' x 6' and the banks should increase to a minimum of 12-4" C at the Core Network locations. The Core Network locations should also have two points of entry.

The internet service is presently provided by CENIC over AT&T GigaMAN fiber optic cable with a bandwidth of 1GB. The campus will need to evaluate options to increase the bandwidth and data transmission speed in the future, such as 10GB Ethernet.

The campus should evaluate the existing MPOE and Data Center for long term needs to confirm the space available, power available, and cooling available is satisfactory. The building emergency power system capacity to maintain both the network equipment and Data Center room cooling system in operation during an extended utility power outage is essential. Refer to Figure 5 which shows possible routing for new ductbanks to replace the existing campus IT infrastructure. It is recommended that the Data Centers be migrated to the stand alone "Data Center In A Box" concept support by a local standby generator. The stand alone Data Center requires roughly 20'x20' with additional space for a generator..

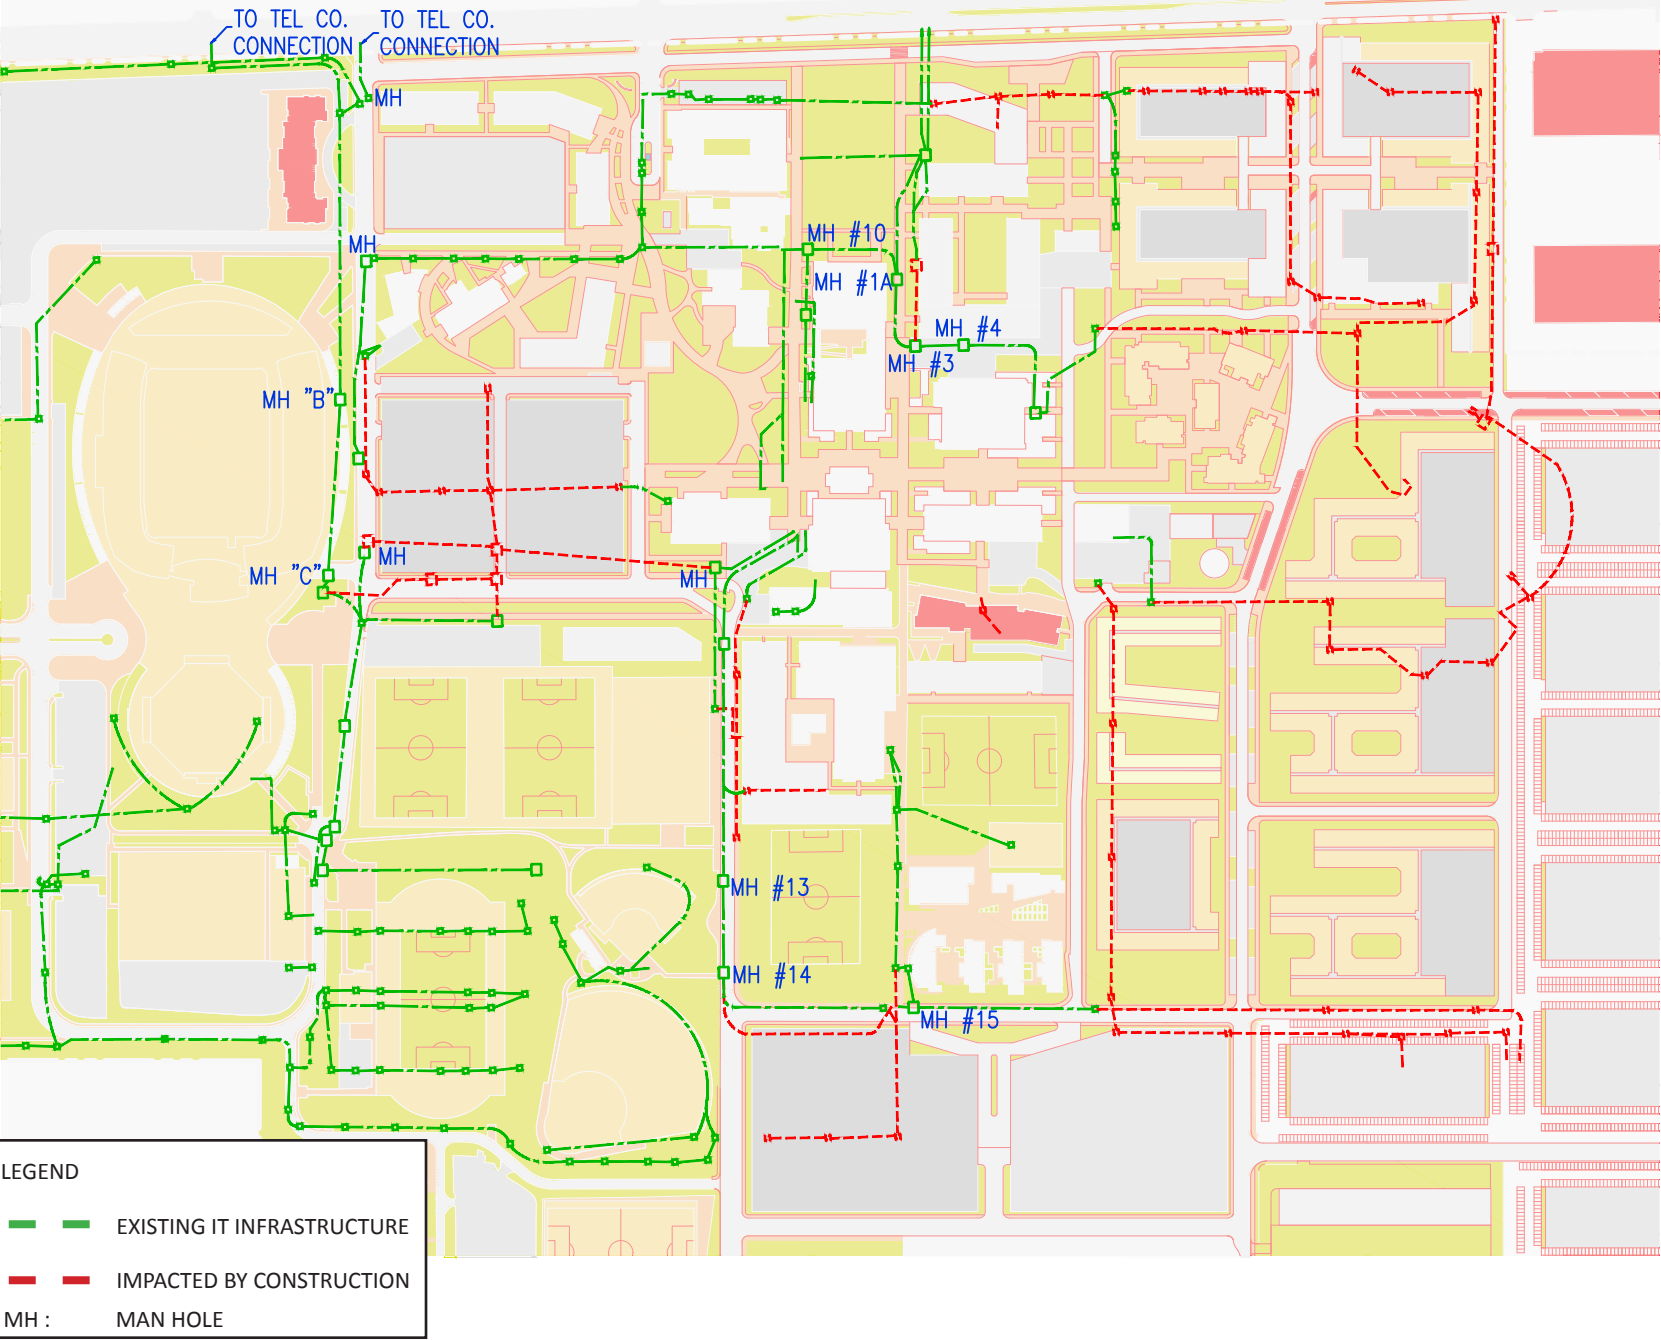

FIGURE 4. EXISTING IT INFRASTRUCTURE IMPACTED BY NEW CONSTRUCTION

PART B: LDP AREA IT INFRASTRUCTURE

A. COMMUNICATIONS, INTERNET, AND DATA ASSOCIATED WITH MASTER PLAN

The LDP area is subdivided into building parcels that will be developed over a 15-year time period. The planned development of the LDP is very dense consisting of 1.7 million GSF of parking structures, 2.5 million GSF of multi-family residential units, 94,000 GSF of retail, 690,000 GSF of apartments, and 591,000 GSF of business park buildings.

The LDP area will be provided with communications, telephone, data, internet, and cable television services by third party providers who will require a pathway to install their cable and equipment to buildings, and occupancies. The LDP will also be connected to the campus network and services. The buildings will require MDF and IDF rooms to house third party and campus equipment. The equipment will include fiber optic cable terminator cabinets, routers, and switches. Each MDF and IDF will require ample power for equipment and cooling loads. The building developer will need to determine the IT services to be provided and work with each service provider to include facilities required for service.

B. DATA AND COMMUNICATIONS OPTIONS FOR THE LDP AREA

Figure 6 includes a site plan with proposed ductbank and manhole infrastructure for data, network, and communications cable systems. The backbone duct bank structure may require up to 12-4" conduits. The ductbank and manhole infrastructure constitute the backbone for the entire LDP. Each service provider will install their own fiber optic cable in the backbone structure to each building or occupancy. Each provider should have their own dedicated 4" conduit into each building. The buildings will be designed to include an MDF to provide adequate space for all third party equipment. Each provider will establish their own requirements. The LDP area IT infrastructure design should be based on industry standards such as the BICSI Customer Owned Outside Plant, Telecommunications Industry Association (TIA) publications, and ANSI/TIA/EIA-758, Customer Owned Outside Plant Telecommunications Cabling Standard.

Connection to the campus network can be accomplished in several ways. The campus can install cable and equipment to provide cloud services, CENIC fiber optic service for academic occupancies, WIFI service in select areas of the LDP such as Student Housing and retail. Connection to the campus network can also be accomplished via LAN, WAN, and VPN. The campus IT depart-

ment will evaluate the extent to which they will support campus network connections within the LDP area for a variety of IT services, and then communicate their requirements for cable and equipment installation to the developer. The IT infrastructure shown in Figure 5 will support the campus cable requirements.

G.3 Errata to the Civil Engineer Report 2017

Civil Engineer Report (2018)

Errata to the Civil Engineer Report (2017)

The appendices that follow this page includes updates to the Civil Engineer Report (Wheeler & Gray, 2017) that was included in the 2018 Campus Master Plan Guidelines as Appendix B.4. This errata is referenced in the Draft Guidelines to the 2018 Campus Master Plan EIR Utilities section as the “Civil Engineer Report. 2018”.

The order of files are as follows:

- G.4 Table 1. Existing Demand Flow (Wheeler & Grey, 2018)
- G.5 Table 2. Proposed Demand Flow (Wheeler & Grey, 2018)
- G.6 Civil Engineer Report Appendix B.4 (Wheeler & Gray, 2017)
- G.7 Civil Engineering Report 2018 Water Supply Narrative (Wheeler & Grey, 2018)

~~G.4 Table 1. Existing Demand Flow~~

G.4 Table 1. Existing Demand Flow has been superseded by G.8 Water Supply Assessment 2019. Table 1 has been removed from the Final EIR Appendix G.

~~G.5 Table 2. Proposed Demand Flow~~

G.5 Table 2. Proposed Demand Flow has been superseded by G.8 Water Supply Assessment 2019. Table 2 has been removed from the Final EIR Appendix G.

G.6 Civil Engineer Report 2017 (Appendix B.4 to the Master Plan Guidelines 2018)

B.4: Civil Engineer Report

The **University Village** is an urban design concept within the CSUDH 2018 Master Plan that integrates the academic core and the student residential community with a neighborhood of retail and business communities and residential apartments to create a live/work/play environment with synergistic connections to the University's mission and purpose. The **Land Development Project** (LDP) is a privately-financed and developed mixed-use project on 76.5 acres within the University Village that includes high-quality rental housing for faculty, staff and community members; retail development; and business park development. It is anticipated that the LDP would be developed as a public-private partnership (P3) which could be constructed over a period of years. Student Residence Halls (Parcels 2A and 2B) and Student Apartments (Parcel 3A) are part of the University Village, but are not currently envisioned as part of the LDP P3 land development.

Unless otherwise noted, the analyses and reports produced for this Appendix include all the parcels of the University Village and are not confined to the parcels of the Land Development Project.

PART A: CORE CAMPUS SANITARY SEWER INFRASTRUCTURE

A. EXISTING SYSTEMS

The existing sewer provides service to the entire CSUDH campus (Central Campus, Child Development Center, Continuing Ed and Facilities) the on-site California Academy of Mathematics and Science School (CAMS) and the Stub Hub sports complex (formerly the Home Depot Center).

Sanitary sewer service is provided to the campus by the City of Carson at four connections; an 8-inch line at the north side of campus on Victoria Street; second a 12-inch pipe on the western portion of the campus on Avalon Blvd which serves the Extended Education buildings as well as the privately owned and run Stub Hub sports complex. The remaining two sewer connections are on the south side of the campus at University Drive; a 12-inch line at Fariman Drive that serves the central campus, Student Housing 2, and the University sports fields to the southwest; and an 8-inch connection to the east of Caney Ave that serves the Physical Plant.

B. SYSTEM CHANGES UNDERWAY (APRIL 2017)

In general, the existing sanitary sewer network on campus is oversized. While this provides

more than sufficient capacity for existing facilities and significant expansion, the system does not create transport velocities in several reaches of the system at peak rates. Additional sewer flow from new buildings and faculties will increase velocities and improve operation of the system. For this reason, no improvements to the downstream reaches are necessary.

Table 1 represents the existing demand flow for both sanitary sewer and domestic water lines. Unit flows can be found from the Board of Directors of County Sanitation District No.8 ordinance. The average water flow must be calculated in order to obtain a sewer peak flow. Loading for Each Class of Land Use – LACSD: <http://www.lacsd.org/civicax/filebank/blobload.aspx?blobid=3531>

Table 2 represents the proposed demand flow for both sanitary sewer and domestic water-lines for new campus buildings. Unit flows can be found from the Board of Directors of County Sanitation District No. 8 ordinance. Loading for Each Class of Land Use – LACSD: <http://www.lacsd.org/civicax/filebank/blobload.aspx?blobid=3531>

TABLE 2. PROPOSED DEMAND FLOW IN CORE CAMPUS

PART B: LDP AREA SANITARY SEWER INFRASTRUCTURE

A. EXISTING SYSTEMS

The existing sewer provides service to the entire CSUDH campus (Central Campus, Child Development Center, Continuing Ed and Facilities) the on-site California Academy of Mathematics and Science School (CAMS) and the Stub Hub sports complex (formerly the Home Depot Center).

Sanitary sewer service is provided to the campus by the City of Carson at four connections; an 8-inch line at the north side of campus on Victoria Street; second a 12-inch pipe on the western portion of the campus on Avalon Blvd. Two sewer connections are on the south side of the campus at University Drive; a 12-inch line at Fariman Drive; and an 8-inch connection to the east of Caney Ave.

B. NEW SYSTEMS

The new sanitary sewer system will have to coordinate with the utility master plan update. It is recommended that appropriate pipe size to achieve sufficient transport flow. The sanitary sewer system for the core campus is oversized and does not create the necessary transport velocities.

LDP sewer lines will connect with campus to help reach the necessary transport velocity. Size sewer pipe for actual flow from low-flow fixtures and design for minimum scour velocity.

The analysis of sanitary sewer system included the Child Care portion of Parcel 4A. It is recognized that the development of a new Child Care/Development Center located along University Drive is expected to be constructed and maintained by the campus.

Table 3. presents proposed sanitary sewer demand flow in the LDP area.

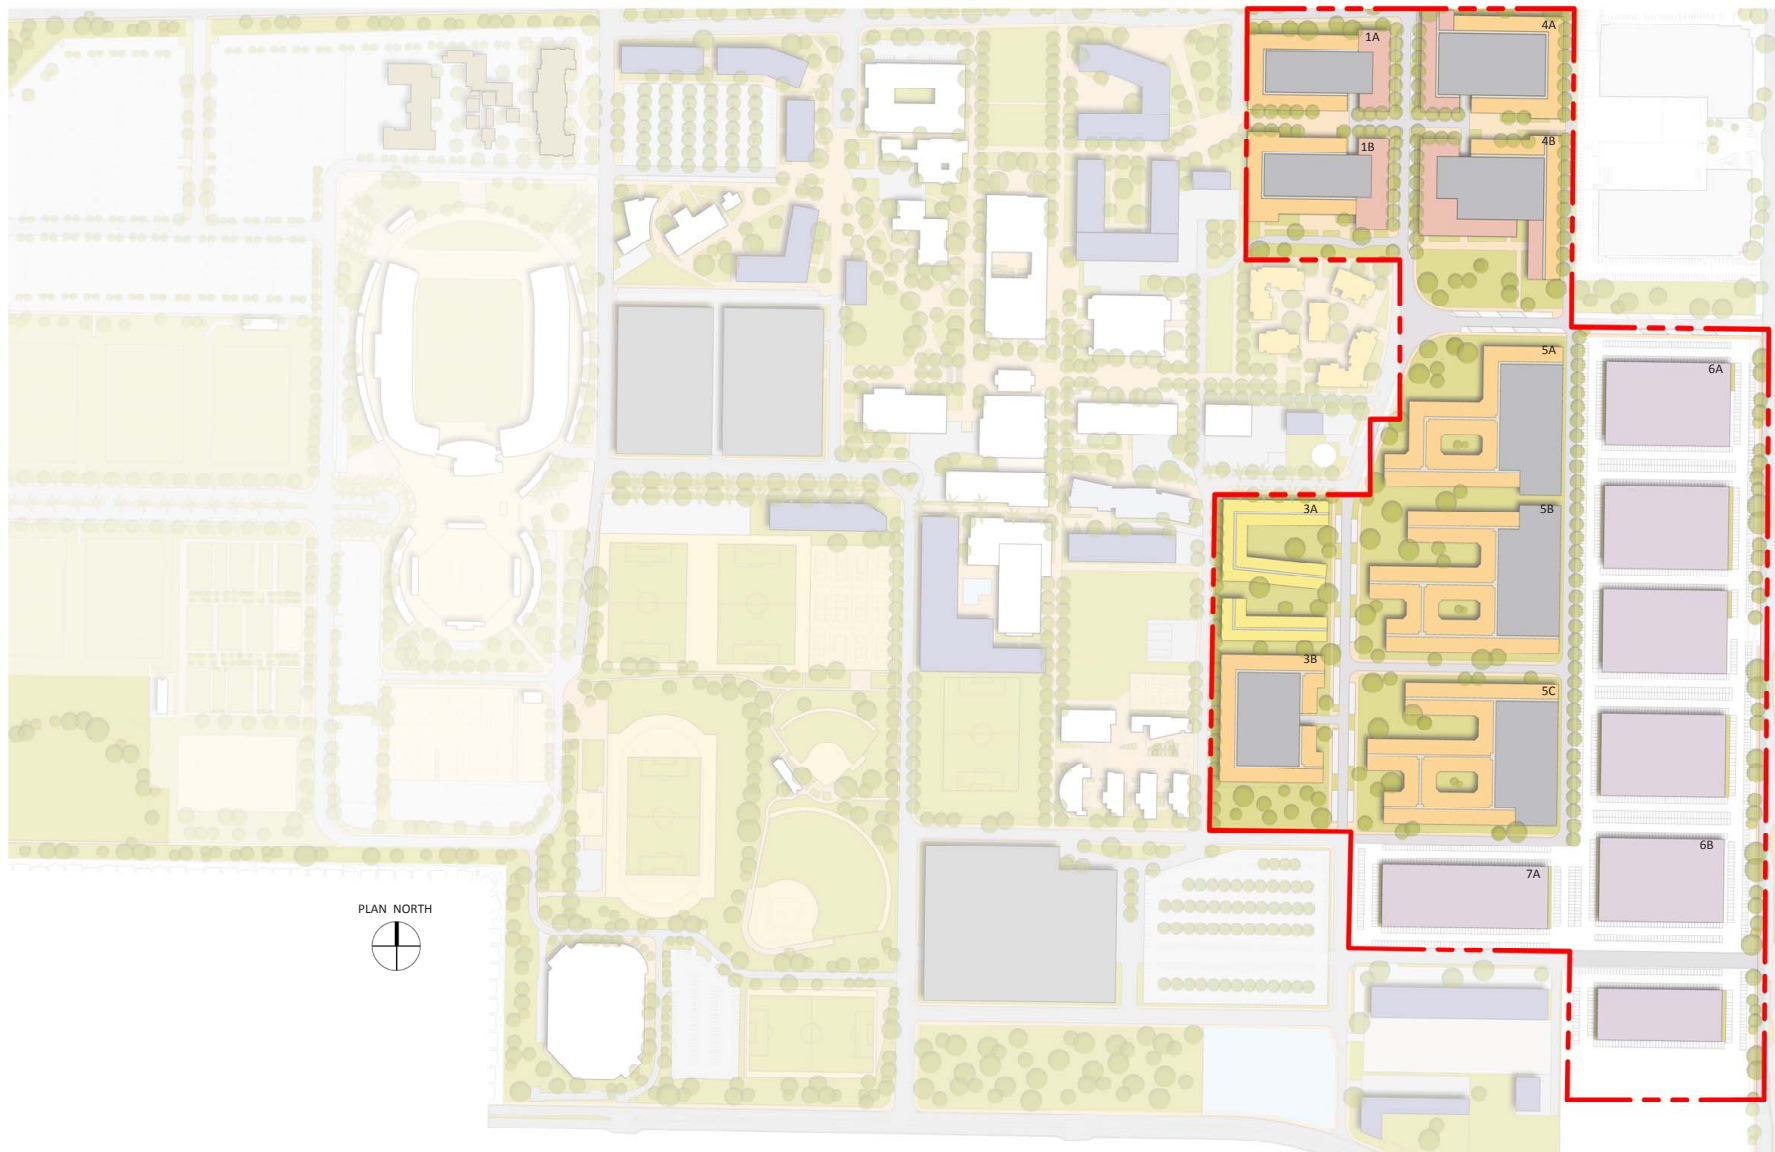

FIGURE 5. LDP BUILDINGS

CAMPUS DOMESTIC WATER INFRASTRUCTURE

DOMESTIC WATER INFRASTRUCTURE HIGHLIGHTS

PART-A: CORE CAMPUS

Core Area: 1.7 million GSF

Long term: Provide new service connection from existing domestic water network.

Strategy: The domestic water system has sufficient capacity to provide potable water to existing facilities and the proposed future facilities. It is expected that with the completion of the additional facilities the water service from Victoria Boulevard will provide additional flow. Under current conditions, that service provides minimal flow.

PART A: CORE CAMPUS DOMESTIC WATER INFRASTRUCTURE

A. EXISTING CONDITIONS

Domestic water service is provided to the CSUDH campus by California Water Service (CWS) Company in Torrance CA. There are numerous connections off the main that run through the southern quarter of the campus (the former main for Dominguez Water Company), from east to west with a tee that turns south to University Drive. The main water service connection for the campus is a 12-inch line on the east side of campus (Detail A on CSUDH Master Utilities Plan for Domestic Water), just east of CAMS. There is a 12-inch connection west on this line for the main campus (Detail B), used as a back-up if pressure drops, which has not happened in recent years. This CWS water main also serves the Stub Hub Complex on separate connections. The third large 12" connection for back-up on campus is from the CWS main in Victoria Street. The Child Development Center (CDC) buildings in the northeast portion of campus have their own connections to the water main in Victoria, each for the CDC and the Infant Toddler Center (ITC). The campus has approximately 34 fire hydrants, not counting the Stub Hub complex. Fire water for the University is served directly off the domestic waterline system for fire hydrants and building fire sprinklers. For this reason, water modeling and analysis is conducted for fire flow

requirements, which guarantees there will be sufficient pressure for domestic use. The campus does not have any water pumps for their domestic/fire water system.

B. SYSTEM CHANGES UNDERWAY (APRIL 2017)

The domestic water system has sufficient capacity to provide potable water to existing facilities and the proposed future facilities. Only laterals from water mains to new buildings will be required.

Table 1 represents the existing demand flow for both sanitary sewer and domestic water lines. Unit flows can be found from the Board of Directors of County Sanitation District No.8 ordinance. The average water flow must be calculated in order to obtain a sewer peak flow. Loading for Each Class of Land Use – LACSD: <http://www.lacsd.org/civicax/filebank/blobdload.aspx?blobid=3531>

TABLE 2. PROPOSED DEMAND FLOW IN CORE CAMPUS

GRAPH 1. EXISTING AND PROPOSED DOMESTIC WATER DEMAND

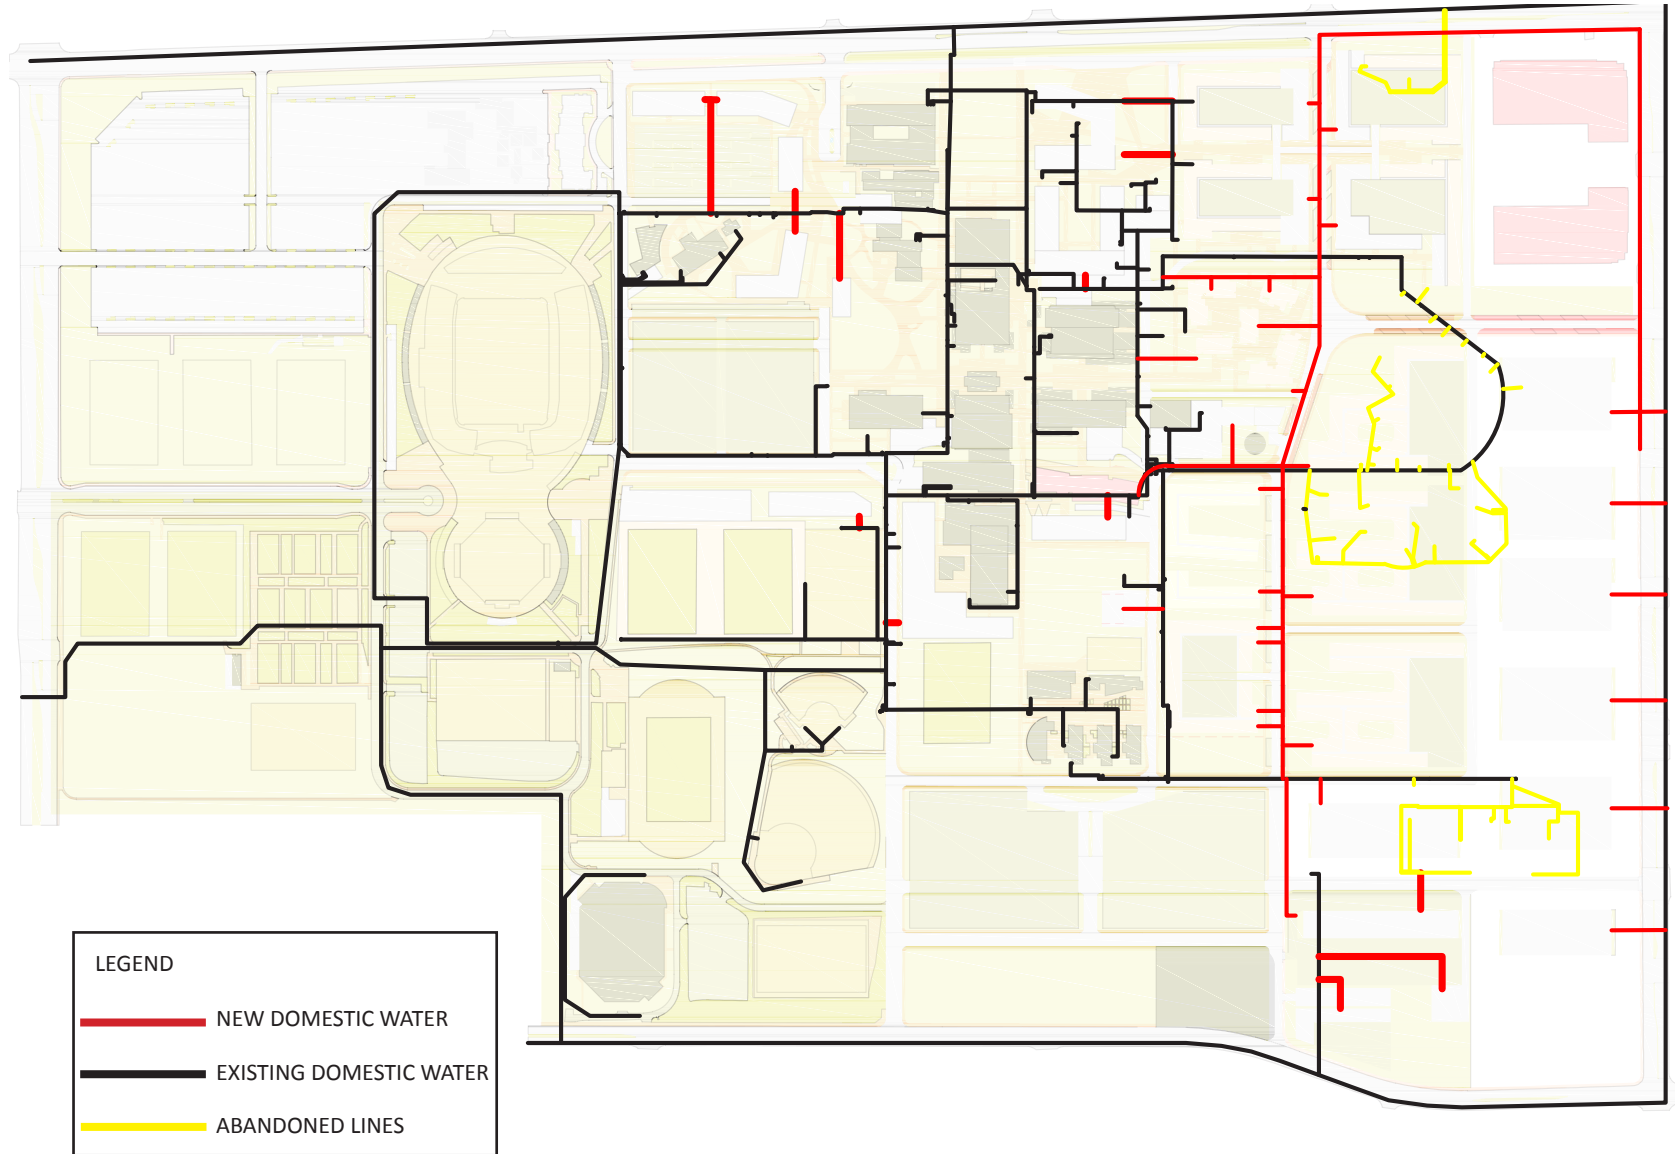

FIGURE 3. EXISTING AND NEW DOMESTIC WATER INFRASTRUCTURE

PART B: LDP AREA DOMESTIC WATER INFRASTRUCTURE

A. EXISTING CONDITIONS

Domestic water service is provided to the CSUDH campus by California Water Service (CWS) Company in Torrance CA. The main water service connection for the campus is a 12-inch on the east side of. There is a 12-inch connection west on this line for the main campus (Detail B), used as a back-up if pressure drops, which has not happened in recent years. This CWS water main also serves the Stub Hub Complex on separate connections. The third large 12" connection for back-up on campus is from the CWS main in Victoria Street. The Child Development Center (CDC) buildings in the northeast portion of campus have their own connections to the water main in Victoria, each for the CDC and the Infant Toddler Center (ITC). The campus has approximately 34 fire hydrants, not counting the Stub Hub complex. Fire water for the University is served directly off the domestic waterline system for fire hydrants and building fire sprinklers.

B. NEW CONDITIONS

The Core campus and land development will have a loop domestic water system. New connections for the land development will be located on Victoria street and Central avenue. The Core campus and land development will each have separate meters for separate billing. Only laterals from water mains to new buildings will be required.

The analysis of domestic water system included the Child Care portion of Parcel 4A. It is recognized that the development of a new Child Care/Development Center located along University Drive is expected to be constructed and maintained by the campus.

Table 3. presents the proposed demand flow for domestic water in the LDP area.

PART A: CORE CAMPUS STORM DRAINAGE INFRASTRUCTURE

A. EXISTING SYSTEMS

The existing storm drain system that serves the main portion of the University discharges through a 60-inch connection to a LA County Public Works storm drain on the south side of campus at University Drive and Campaign Drive. The Student Health Center (SHC # 25) has recurring issues with ponding in the parking area on the southwest side, often flooding the south entrance to the building. The SHC also experiences, to a lesser degree, ponding on the north side, which has been known to impact Welch Hall. On the east side of University Theater, the basement stairwell has had chronic problems with flooding, even in the smallest rain storm. A new sump-pump was installed several years ago, but is breaking down and unable to handle minor storm water discharges.

B. SYSTEM CHANGES UNDERWAY (APRIL 2017)

Existing downstream capacities are limited. Site designers of new projects must contact Los Angeles County Public Works to obtain requirements for limitations of discharge rates. Los Angeles County has limited storm water discharges to PD 0961 to 1.52 cubic feet per second (CFS) per acre drained during a 50-year storm event and prohibited discharges to PD 242 and MTD 1520. This requires retarding of storm water on-site to reduce peak discharges. The area listed under "Site Area required for Storm Water Mitigation Site Improvement, SF" should be considered a guideline only. Storage lengths that produces volume sufficient for storage capacity.

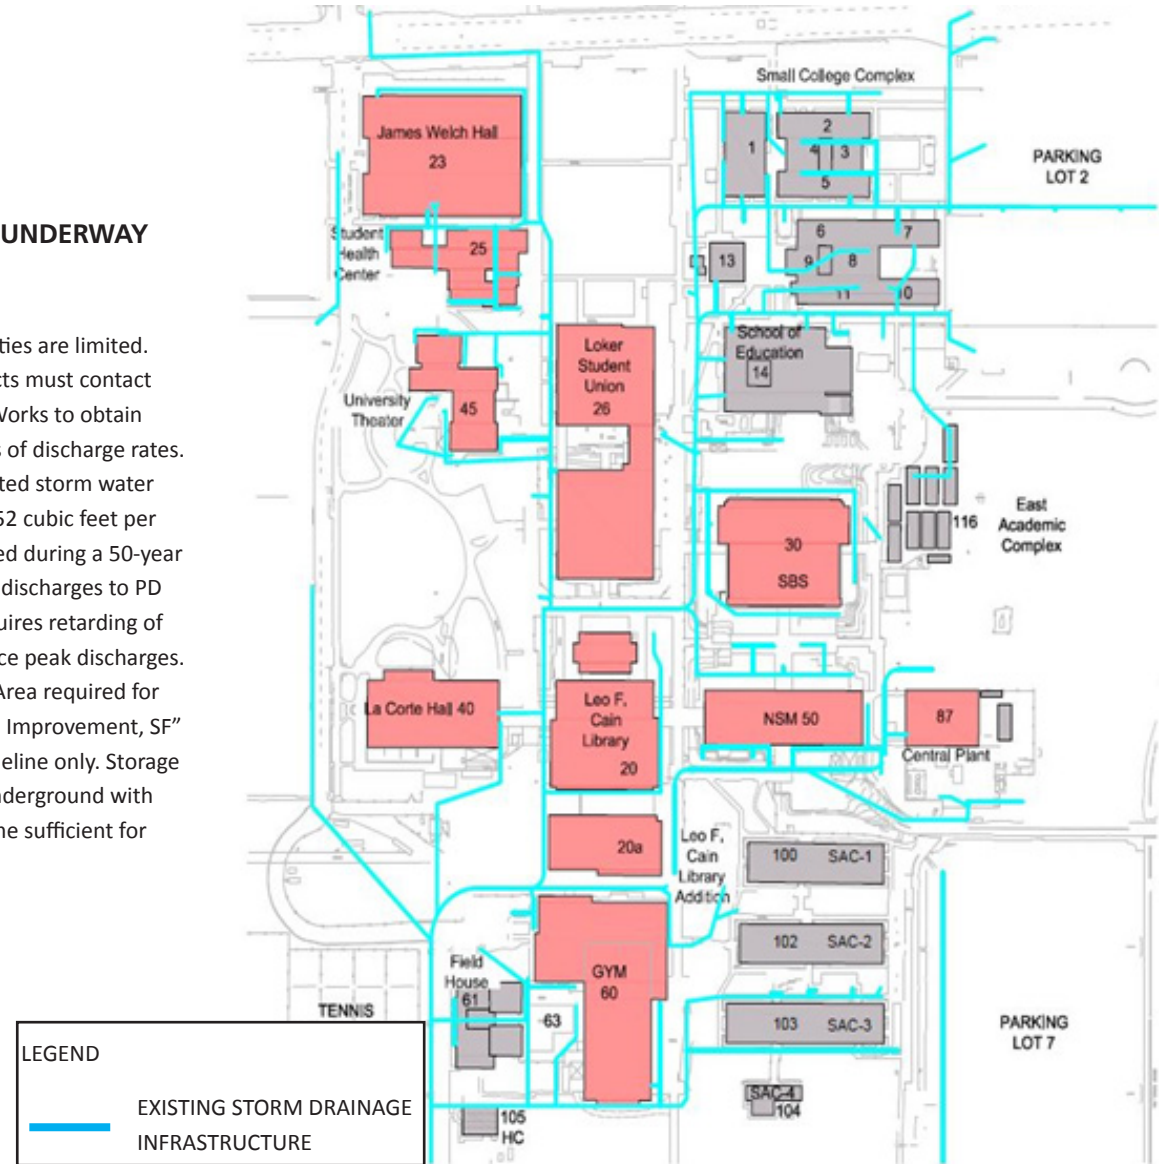

FIGURE 2. EXISTING STORM DRAINAGE INFRASTRUCTURE

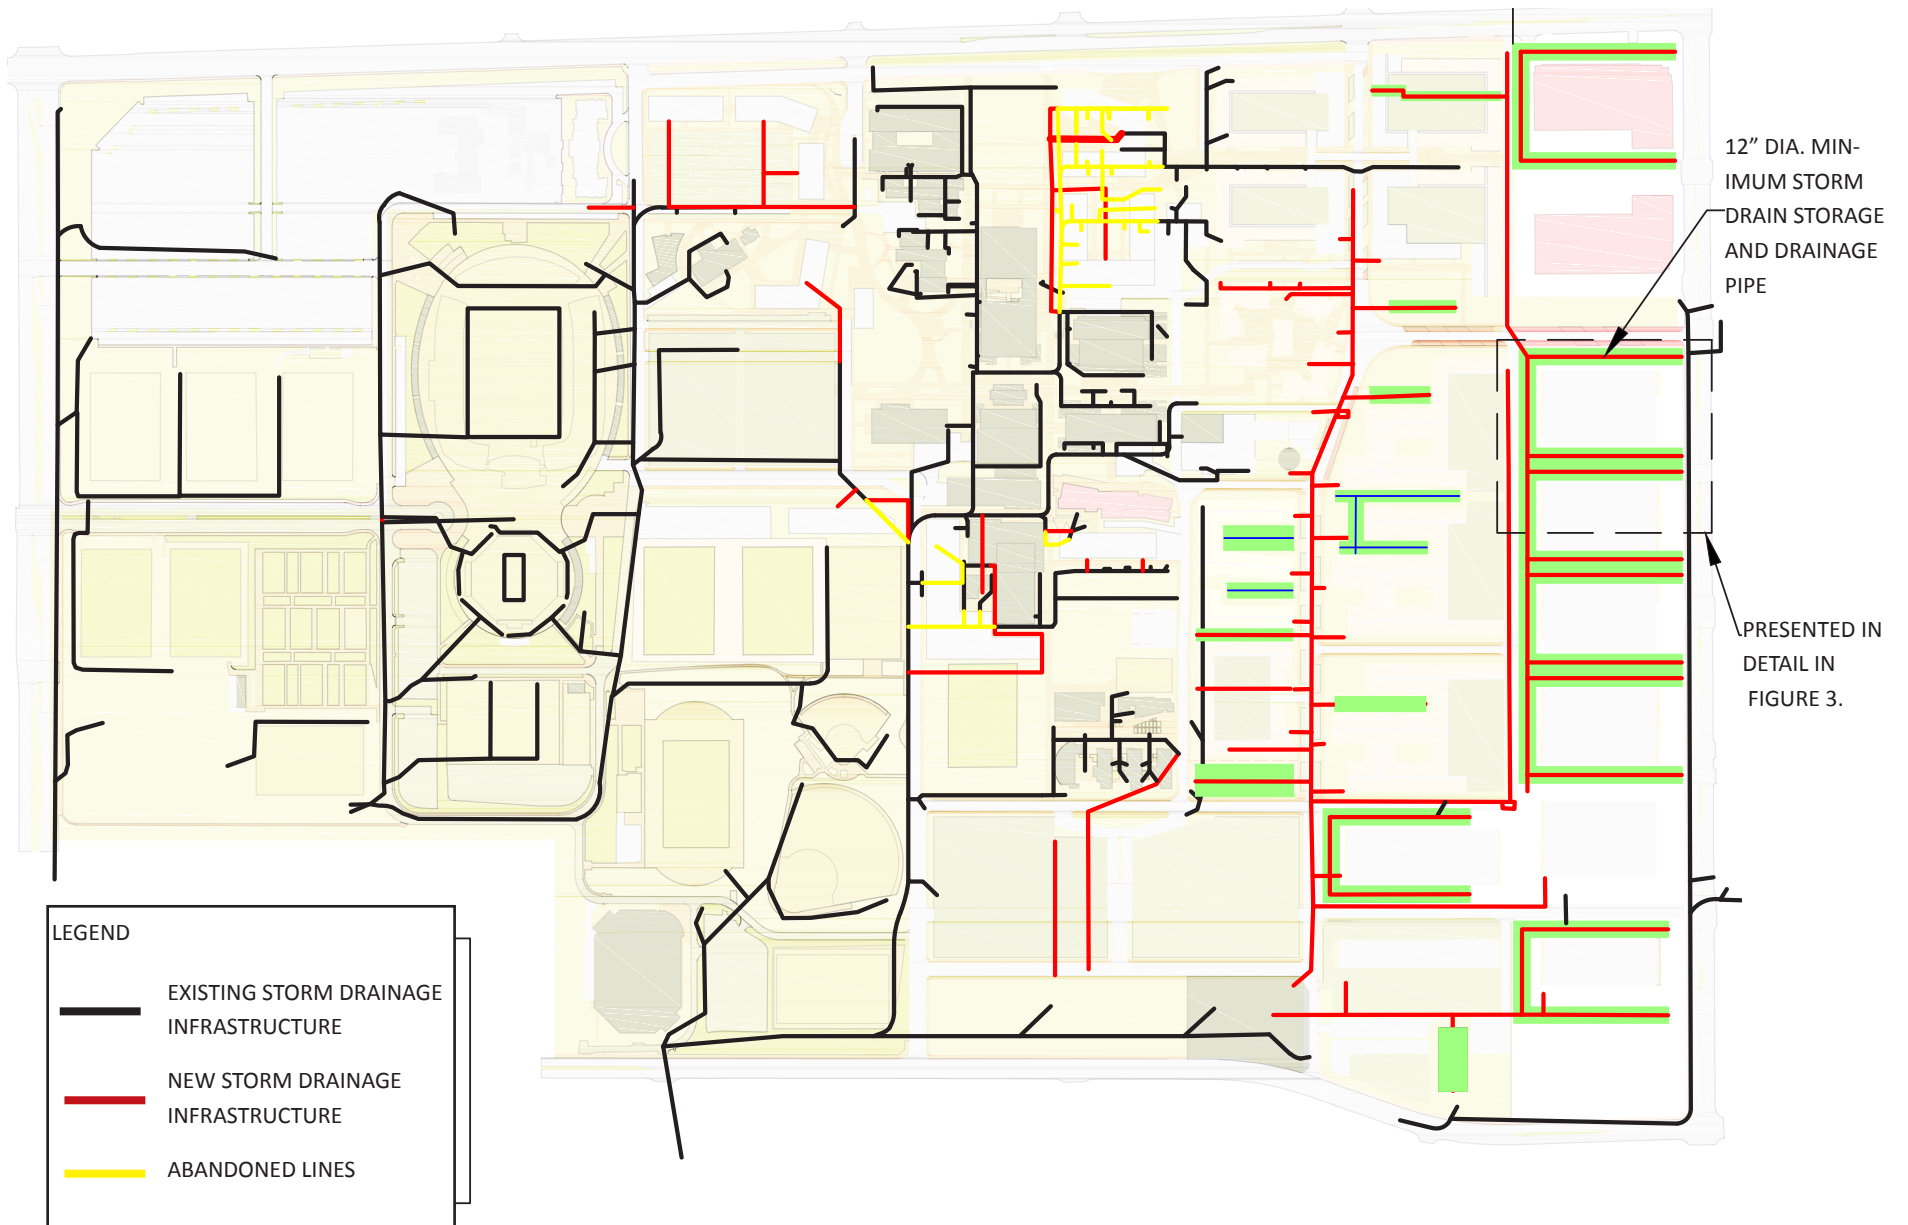

FIGURE 3. EXISTING AND NEW STORM DRAINAGE INFRASTRUCTURE

PART B: LDP AREA STORM DRAINAGE INFRASTRUCTURE

As with the main campus, the new restriction by Los Angeles County limits storm water discharges to PD 0961 (County Constructed) to 1.52 cubic feet per second (CFS) per acre drained during a 50-year storm event and prohibits discharge to PD 242 and MTD 1520. This requires retarding of storm water on-site to reduce peak discharges.

Wheeler & Gray determined through hydrologic modeling using the Army Corps of Engineers' HEC-RAS program that attenuation of peak discharges from upstream parcels to downstream parcels would be impractical. It would require large areas and/or volumes to be retarded at each parcel before discharging to a downstream parcel. This scheme was not pursued because modeling showed flooding when using planter volumes typical for commercial developments.

Instead, Wheeler & Gray determined the peak discharge from a typical parcel using Los Angeles County Department of Public Works' HydroCalc 1.0.2 modeling software to produce a hydrograph for a small area. The typical parcel used is Business Park 1 of the Land Development Plan. The area of the site in acres was multiplied by 1.52 CFS/Acre to determine the peak allowable discharge for a site of the size of this typical parcel. In the case of the example presented in this Master Plan,

that rate is 6.56 CFS. A line at this rate was drawn across the hydrograph to show the volume of discharge that is required to be stored on site. The volume calculated is 2,305 cubic feet (CF). This volume can be stored within the concept planter area, which was assumed will be constructed at an invert slope of 0.5%, and approximately 1,200 feet of 18-inch diameter pipe.

For each site, storage pipes can be constructed under parking lots and driveways to provide sufficient storage capacity. The pipe will also serve to drain the buildings and parking lots.

Each lot will drain separately to main lines in the development area. A restriction between the storage the parcels and main lines will limit discharge to the rate provided by the County.

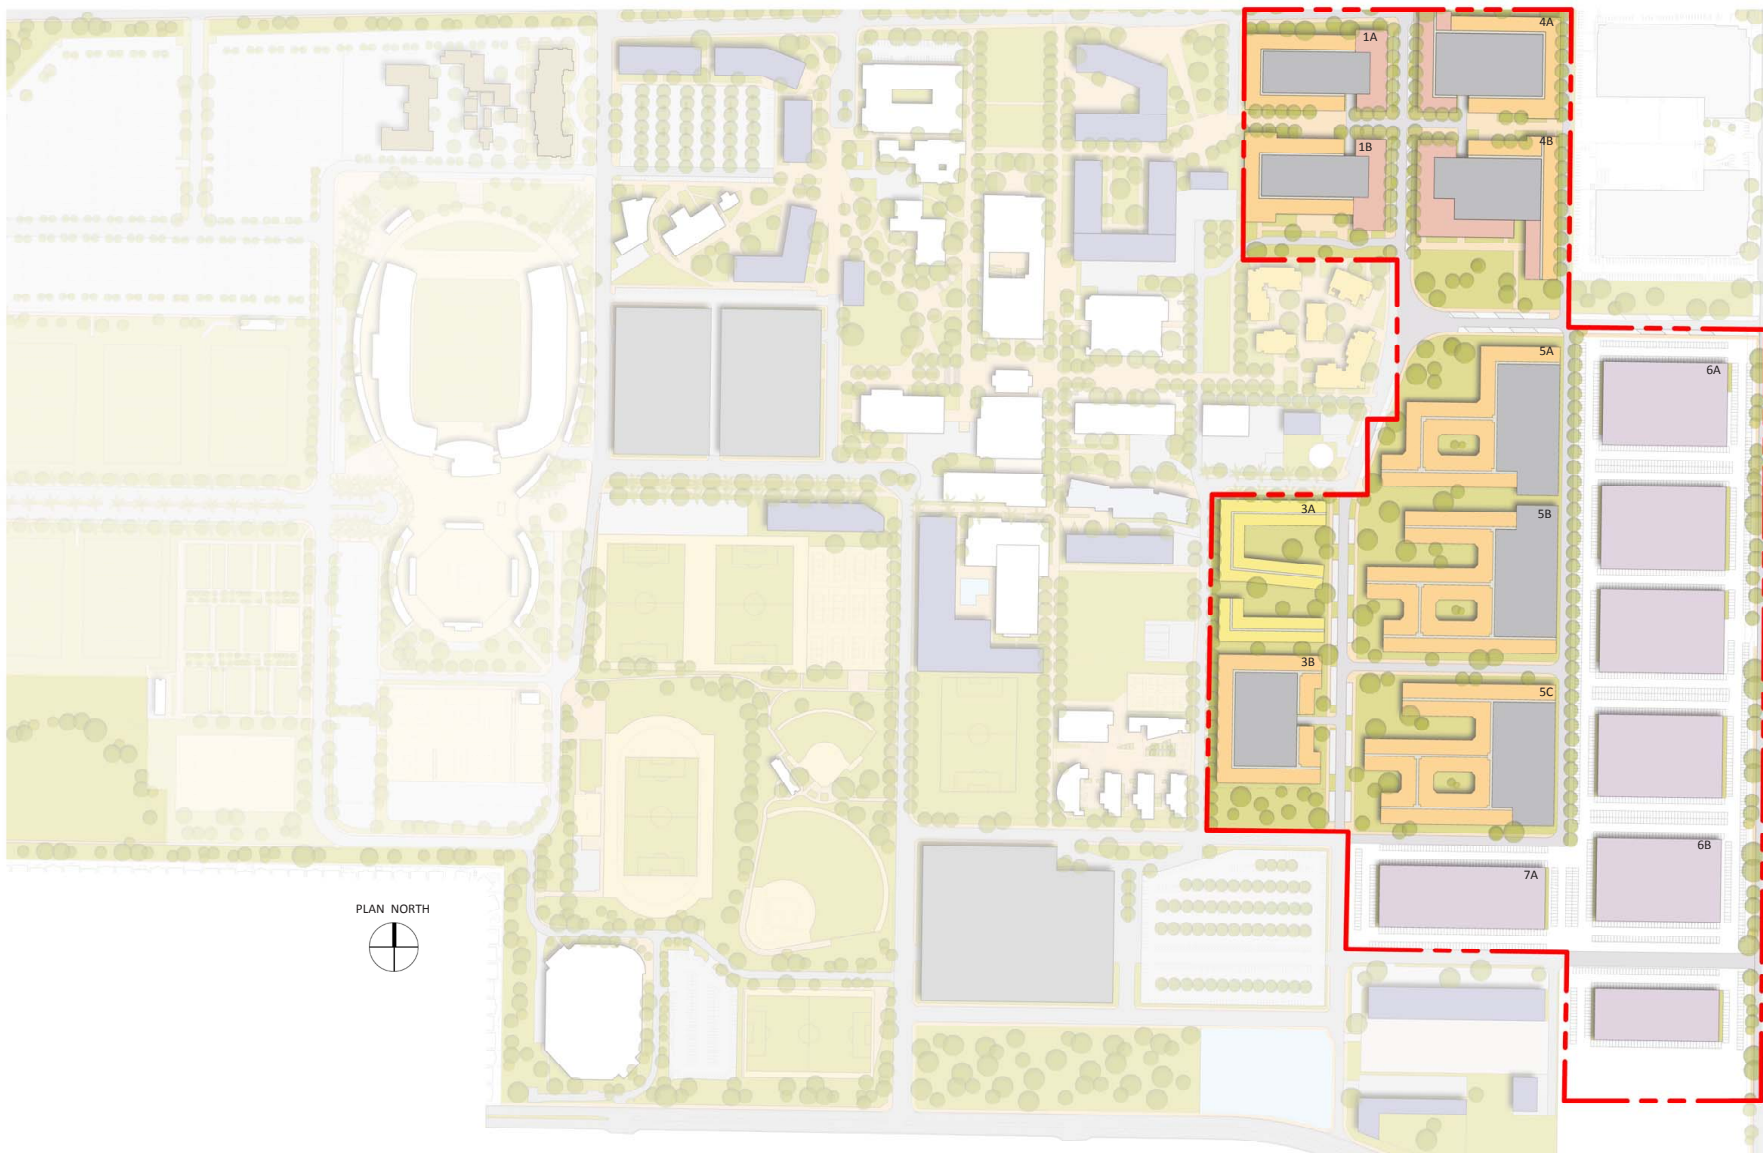

FIGURE 7. LDP BUILDINGS

**G.7 Master Plan Water Infrastructure & Proposed
Project Water Demand Supply Narrative to the Civil
Engineering Report, 2017**

A1. Existing Conditions -Sanitary Sewer

The existing sanitary sewer provides service to the CSUDH campus (Central Campus, Child Development Center, Continuing Ed and Facilities), the on-site California Academy of Mathematics and Science School (CAMS) and the Stub Hub sports complex (formerly the Home Deport Center).

Sanitary sewer connections are owned and operated by the City of Carson. There are four connections; an 8-inch line on the north side of campus on Victoria Street; a 12-inch line on the western portion of the campus on Avalon Boulevard, which serves the Extended Education buildings and the privately owned and operated Stub Hub sports complex; a 12-inch line at Fariman Drive that serves the central campus, Student Housing 2, and the University sports fields to the southwest; and an 8-inch connection to the east of Caney Avenue that serves the Physical Plant.

A2. System Changes – Sanitary Sewer

In general, the existing sanitary sewer network on campus is oversized. While this provides more than sufficient capacity for existing facilities and significant expansion, models of the system show that it does not achieve transport velocities in several reaches of the system at peak rates. Additional sewer flow from new buildings and faculties will increase velocities and improve operation of the system. For this reason, no improvements to the downstream reaches are necessary.

The total increase in effluent discharge to campus and downstream sanitary sewer systems

will consist of additional flows due to increase in the Full Time Equivalent (FTE) student count, net increase in student housing, new market rate residences, new commercial development that will part of the University Village plan and an addition of 3,000 spectator seats to the Stub Hub Center. Note that in the table Proposed Demand Flows the rate shown for future discharge from the Stub Hub Center exceeds the capacity of the downstream system. The proposed flows are split between multiple laterals and will enter the downstream system at different point; therefore, the component flows will not exceed capacity.

The increase in FTE student is calculated using a current FTE student count of 11,533. The proposed increase to an FTE of 20,000 students is an increase of 8,467 FTE students. The increase in sewer discharge attributable to FTE student increase is calculated using Los Angeles County Sanitation District's (LACSD) Mean Loading tabulation for a College/University campus is 20 gallons per day per student. This results in an increase of 169,340 gallons per academic day (GPD), or 0.17 million gallons per day (MGD). Total annual discharge will be calculated based on an academic calendar of 240 days, including summer sessions and non-credit events.

Student housing will increase by a net 988 beds. Using LACSD's Mean Loads for a Rooming House and two beds per Room results in an increase of discharges of 61,750 GPD, or 0.06 MGD. Total annual discharge will be calculated based on 10 months of residency.

The University Village project will create 2,149 market rate apartments. Using LACSD's Mean

Loading for Multi-Unit Residential units, this will result in an increase of discharges of 0.34 MGD.

The University Village elements will include 572, 400 gross square feet of commercial business space. Using LACSD's Mean Loading for Office Building space, this will result in an increase of discharges of 0.11 MGD.

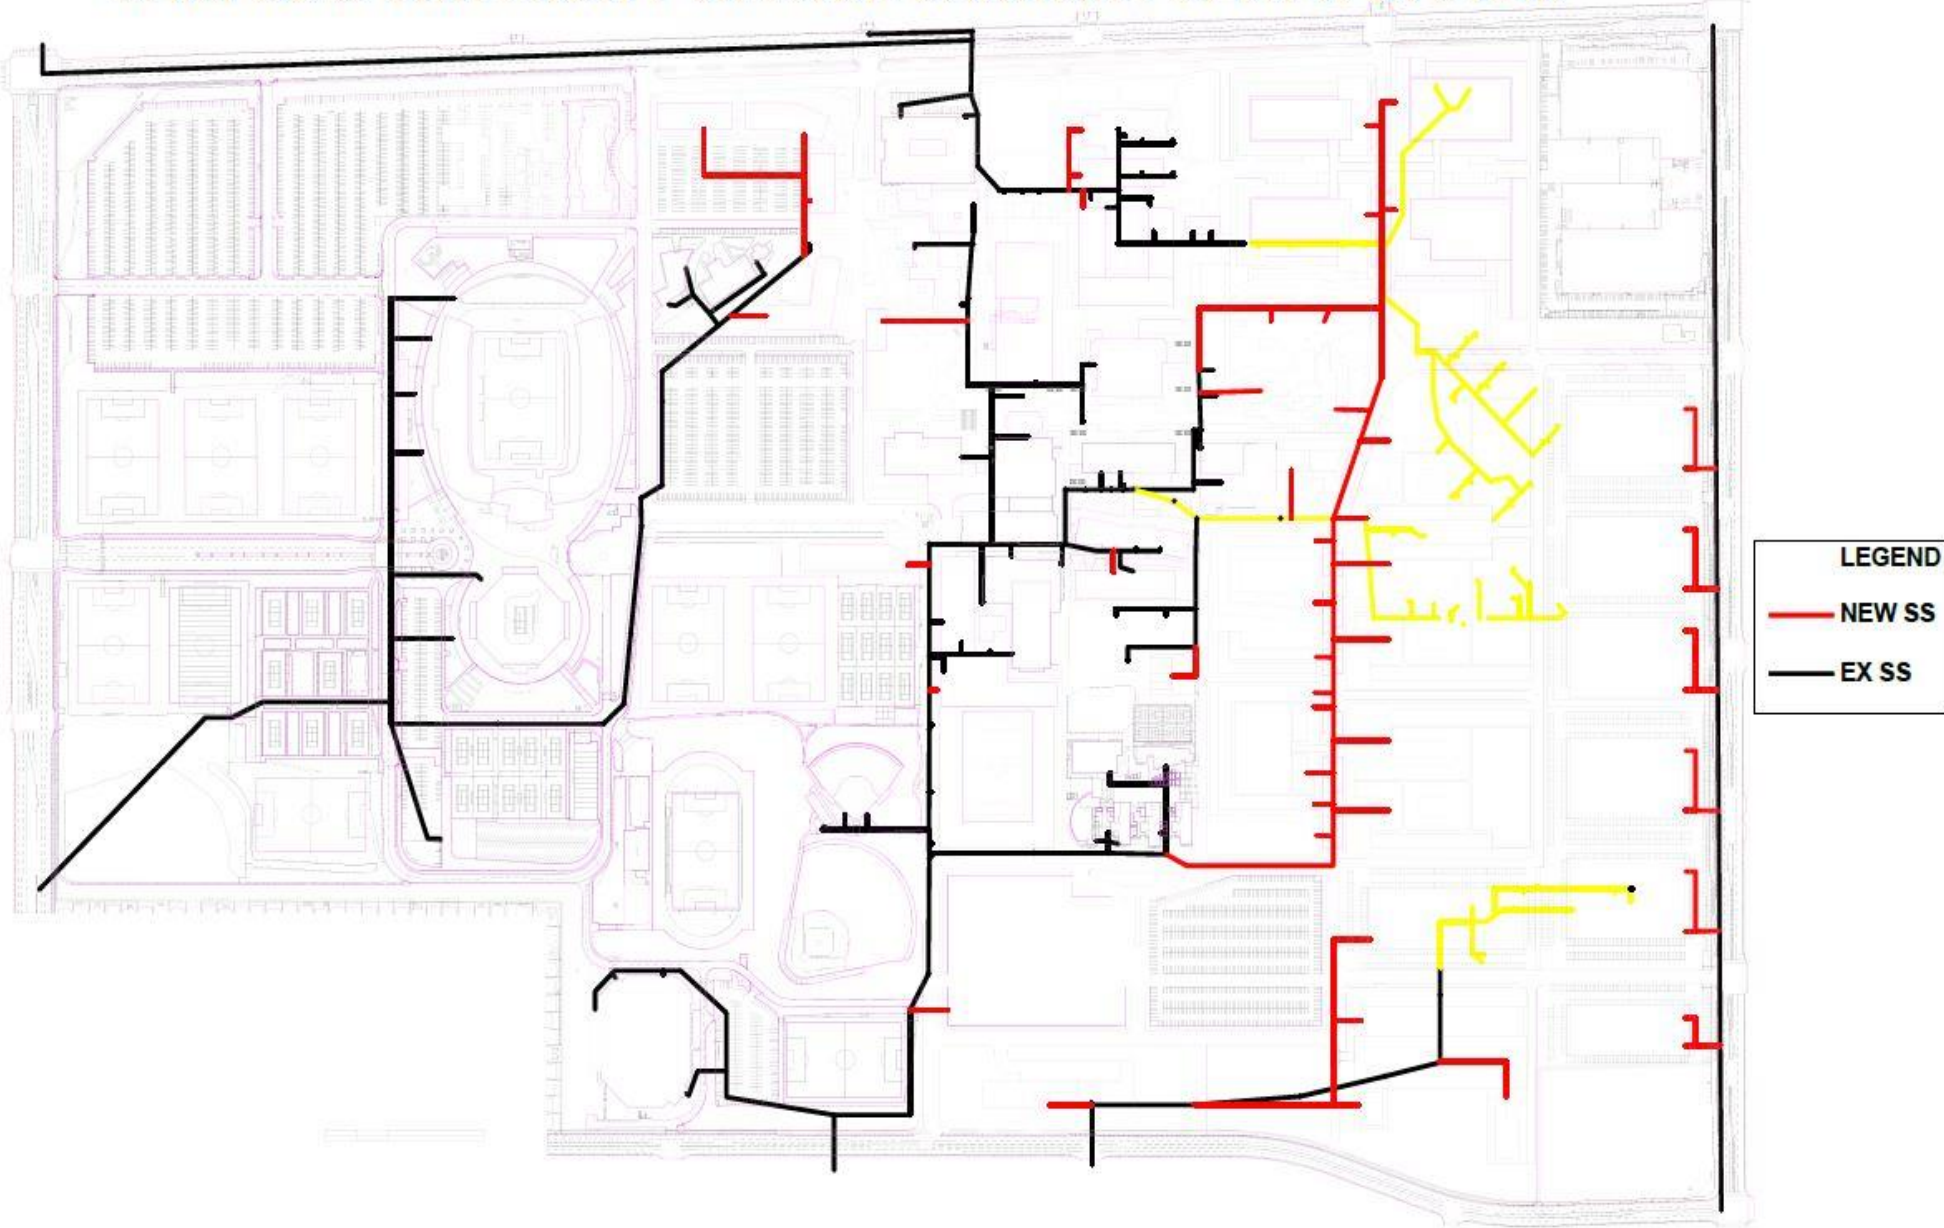

The University Village elements will include 96,085 gross square feet of retail space. Using LACSD's Mean Loading for a Store or Regional Mall results in an increase of discharges of 0.11 MGD.

The Stub Hub Center will increase seating capacity by 3,000 seats. Using LACSD's Mean Loading for a Sports Stadium and the increase in effluent will be 0.03 MGD at peak, which is only during sold out events. The annual increase is based on 24 sold-out events per year.

The total increase in effluent discharge is estimated to be 0.73 MGD at aggregate of peak.

Campus effluent is treated at the Joint Water Pollution Control Plant (JWPCP) in the City of Carson. The plant is owned and operated by the Los Angeles County Sanitation Districts. According to the LACSD (<https://www.lacsd.org/wastewater/wwfacilities/jwpcp/>) the plant has a permitted capacity 400 MGD and is currently operating at 260 MGD. The excess permitted capacity is 140 MGD; therefore, the plant has sufficient capacity to accept the additional effluent discharge.

CAMPUS & UNIVERSITY VILLAGE SANITARY SEWER SYSTEM

B1. Existing Conditions – Domestic (Potable) Water

Domestic water service is provided to the CSUDH campus by California Water Service (CWS) Company in Torrance CA. There are numerous connections from a water main that run through the southern quarter of the campus (the former main for Dominguez Water Company), from east to west with a tee that turns south to University Drive. The main water service connection for the campus is a 12-inch line on the east side of campus (Detail A on CSUDH Master Utilities Plan for Domestic Water), just east of CAMS. There is a 12-inch connection west on this line for the main campus (Detail B), used as a back-up if pressure drops, which has not happened in recent years. This CWS water main also serves the Stub Hub Complex on separate connections. The third large 12" connection for back-up on campus is from the CWS main in Victoria Street. The Child Development Center (CDC) buildings in the northeast portion of campus have separate connections to a main in Victoria, each for the CDC and the Infant Toddler Center (ITC). The campus has approximately 34 fire hydrants, not including the Stub Hub complex. Fire water for the University is served directly off the domestic waterline system for fire hydrants and building fire sprinklers. For this reason, water modeling and analysis is conducted for fire flow requirements, which guarantees there will be sufficient pressure for domestic use. The campus does use pumps for their domestic/fire water system.

B2. System Changes – Domestic (Potable) Water

The domestic water system has sufficient capacity to provide potable water to existing facilities and the proposed future facilities. Only laterals from water mains to new buildings will be required.

Domestic water demand will increase as the various elements of the master plan are executed. Estimated waster demands are calculated using Los Angeles County Sanitation District' Mean Loadings for District 8. Note that the campus is irrigated with reclaimed water; therefore, no irrigation water is included in the domestic water demand increases.

Campus Full Time Equivalent (FTE) Students will increase by 8,467. The increase in water demand attributable to FTE student increase is 20 gallons per day per student estimated using Los Angeles County Sanitation District's (LACSD) Mean Loading tabulation for a College/University campus. This results in an increase of 169,340 gallons per academic day (GPD) and 125 acre-feet (AF) per year based on an academic calendar of 240 days, including summer sessions and non-credit events.

Student housing will increase by a net 988 beds. Using LACSD's Mean Loads for a Rooming House and two beds per Room results in and increase in demand of 61,750 GPD and 58 AF per based on 10 months of residency.

The University Village project will create 2,149 market rate apartments. Using LACSD's Mean Loading for Multi-Unit Residential units, this will increase demand by 375 AF per year.

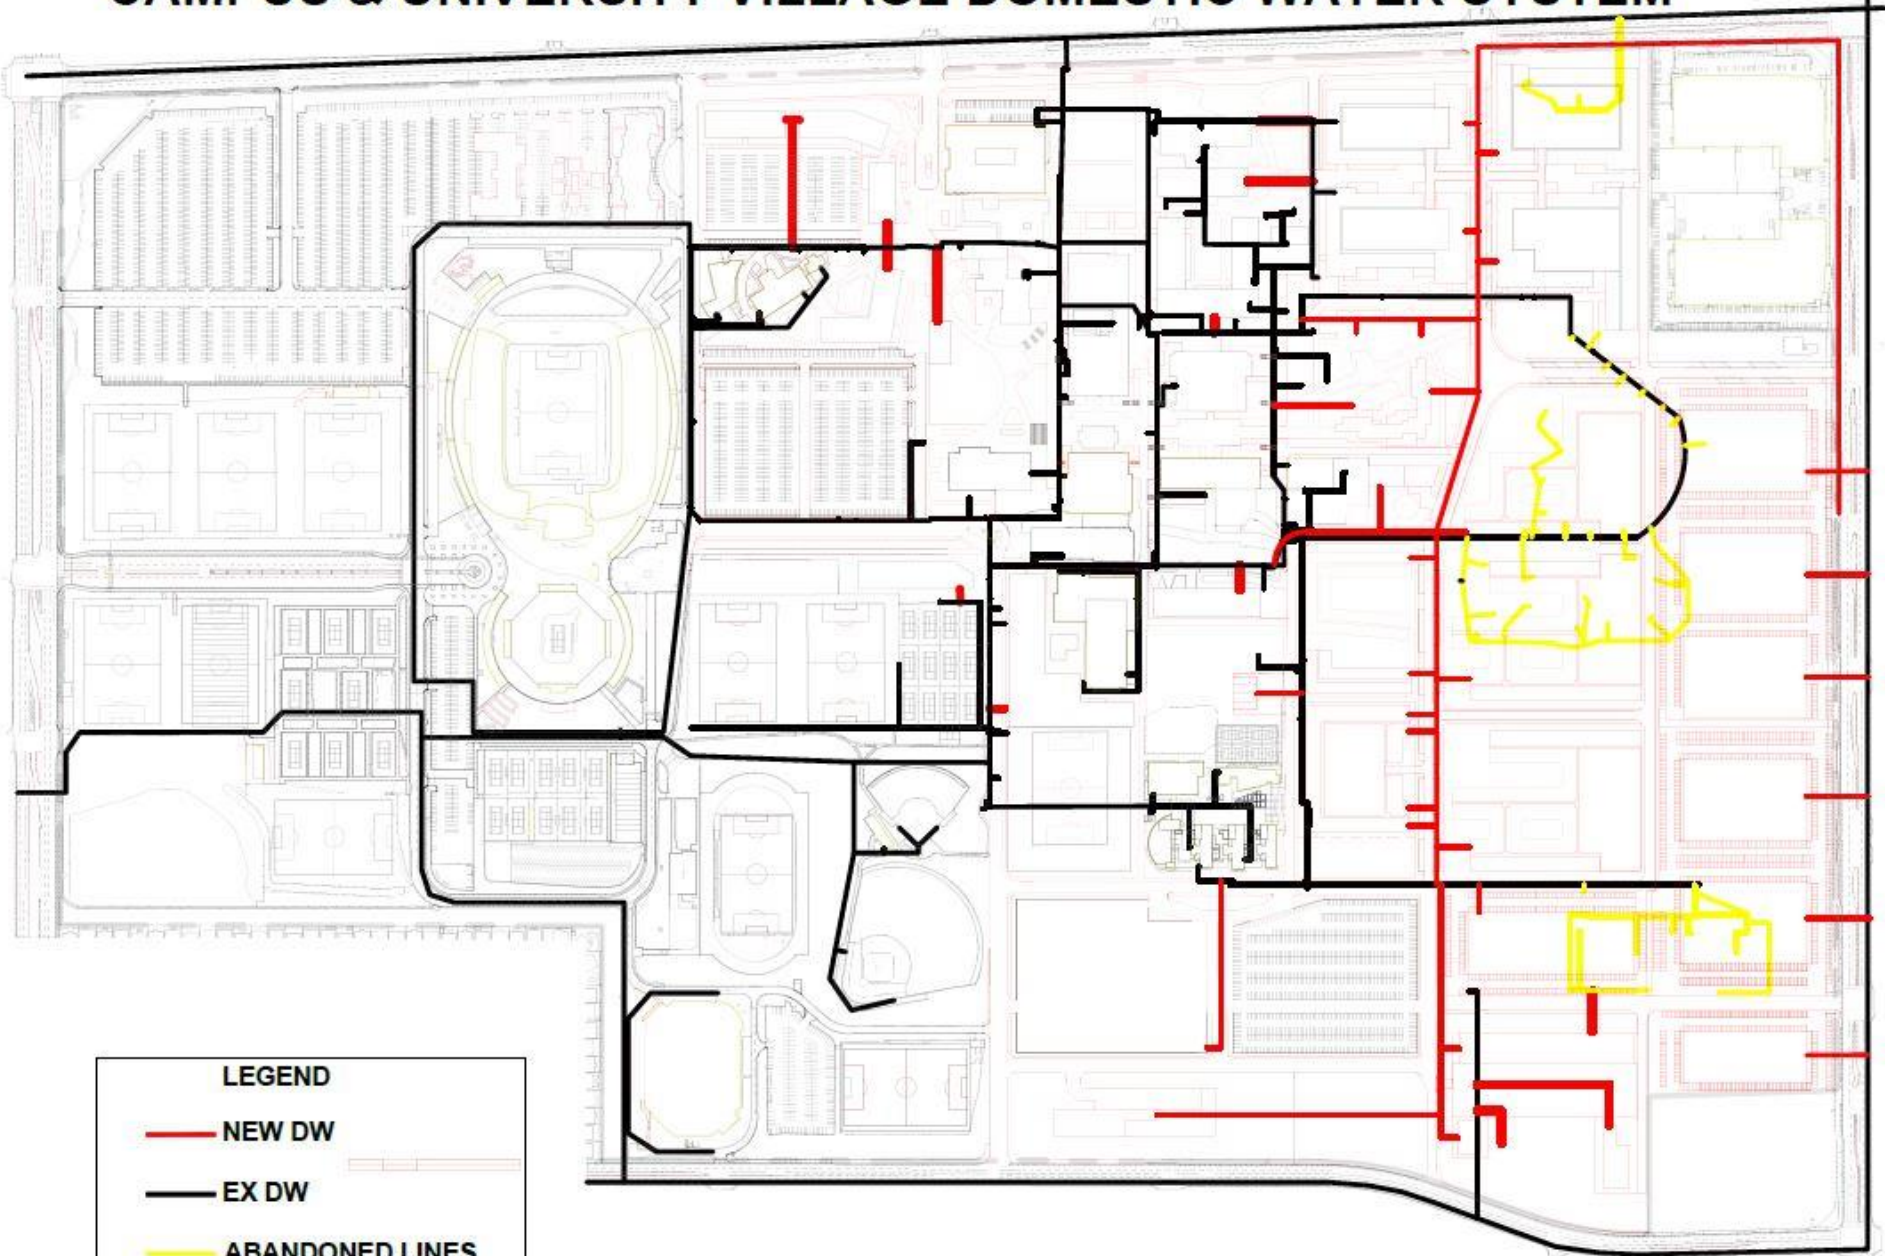

The University Village elements will include 572, 400 gross square feet of commercial business space. Using LACSD's Mean Loading for Office Building space, this will increase demand by 128 AF per year.

The University Village elements will include 96,085 gross square feet of retail space. This will increase demand by 16 AF per year.

The Stub Hub Center will increase seating capacity by 3,000 seats. Using LACSD's Mean Loading for a Sports Stadium and 24 sold-out events per year, the increase in demand will be 2 acre-feet per year.

Total annual increase in domestic/potable demand is estimated to be 648.8 acre-feet. The campus is served by California Water Service. (CWS). According to CWS's 2015 Urban Water Management Plan (UWMP) CWS will provide 31,508 acre-feet of water in 2020 and 31,683 acre-feet in 2030. From the UWMP, CWS's available purchased and ground water supplies will be 34,796 AF in 2020 and 34,701 AF in 2035. Projected demands for potable water are 31,508 AF in 2020 and 31,528 AF in 2030. CWS has sufficient available water to provide for the estimated increase.

CAMPUS & UNIVERSITY VILLAGE DOMESTIC WATER SYSTEM

C1. Existing Conditions - Storm Drain

The existing storm drain system that serves the main portion of the University discharges through a 60-inch connection to a Los Angeles County Public Works storm drain on the south side of campus at University Drive and Campaign Drive. The Student Health Center (SHC # 25) has recurring issues with ponding in the parking area on the southwest side, often flooding the south entrance to the building. The SHC also experiences, to a lesser degree, ponding on the north side, which has been known to impact Welch Hall. On the east side of University Theater, the basement stairwell has had chronic problems with flooding, even in the smallest rain storm. A new sump-pump was installed several years ago, but is breaking down and unable to handle minor storm water discharges.

C2. System Changes – Storm Drain

Existing downstream capacities are limited. Los Angeles County has limited storm water discharges to PD 0961 to 1.52 cubic feet per second (CFS) per acre drained during a 50-year storm event and prohibited discharges to PD 242 and MTD 1520. No new storm drain facilities downstream of campus will be constructed to accept increased flow. The campus will retain or retard storm water discharges on campus to limit peak discharges from individual project site to 1.52 CFS. This will be accomplished by surface storm water retention areas and sub-surface retention structures, such as oversized pipes.

G.8 Water Supply Assessment 2019

CALIFORNIA WATER SERVICE

Rancho Dominguez District 2632 West 237th Street
Torrance, CA 90505 Tel: (310) 257-1400

June 18, 2019

Jay Bond
California State University, Dominguez Hills
1000 East Victoria Street, WH B470
Carson, CA 90747

California Water Service Company is pleased to present the requested water supply assessment, "California SB 610 Water Supply Assessment (WSA) for the proposed California State University Dominguez Hills Campus Master Plan", dated June 18th, 2019. California Water Service Company has served the site since 1960 and continues to serve it through our Dominguez District distribution Zone 2 service connections on Avalon Boulevard and Central Avenue.

We have provided the WSA for your use for clearance and/or permitting through the local regulating agencies. The WSA concludes that for the next 20 years, the Dominguez District will have adequate water supplies to meet the projected demands associated with the proposed California State University Dominguez Hills development project and those of all existing customers and other anticipated future users.

Please contact Ralph Felix at (310) 357-6410, if you have any questions concerning the WSA or our ability to continue serving the project.

Thank you,

Daniel Armendariz
District Manager

Introduction and Project Description

California Water Service Company (Cal Water) is submitting the following California SB 610 Water Supply Assessment (WSA) for the proposed California State University, Dominguez Hills Campus Master Plan hereafter called the CSUDH CMP.

The proposed project is the adoption and implementation of CSUDH's 2018 Campus Master Plan, which provides a development plan that will accommodate growth from the current enrollment of approximately 11,000 FTES to a maximum enrollment of 20,000 FTES over a planning horizon extending to 2035. The proposed project serves to revise and update the previously approved Campus Master Plan, which provided for a number of new campus facilities and improvements. The proposed project entails development of new and expanded facilities in three areas of the 344- acre campus: (1) the Core Campus; (2) the University Village; and (3) the StubHub Center.

The Core Campus project component occupies 179.5 acres and includes:

- twelve new academic and administrative facilities, including: classrooms, laboratories, faculty and administrative offices, new performing arts facilities, a new incubator/research facility,
- and facilities for accommodating CSUDH's new mobile Fabrication Lab vehicles;
- student support facilities, including: an expansion of the Loker Student Union, new student apartment housing,
- and a new student recreation center;
- athletic facilities, including: a remodeled gymnasium and existing and new playfields;
- campus support facilities, including: a new, expanded Child Care Center, new Facilities Services offices and yards, expansion of the existing Central Plant, a satellite central plant; and a new electric substation.
- parking facilities to accommodate 20,000 FTES, including reconfigured surface lots and new parking structures;
- reconfigured campus entries at both north and south, including new campus visitor services and reconfigured vehicle access to parking facilities;
- open space areas for campus activities, programmed and informal gathering and recreation; and
- existing natural reserve areas and a new area for an urban farm project.

The University Village project component occupies 76.5 acres and is a new planned mixed-use campus development that includes:

- new retail uses to support both the Core Campus and the University Village, including on-street parking and parking in structures;
- new housing, including market-rate apartments, which will provide housing for faculty and staff, students and the general public;
- business park development targeted to uses compatible with and supportive of the University's educational mission;
- open space areas for informal activities, leisure, gathering and recreation
- preservation of an existing natural reserve area; and

- reconfigured vehicle circulation including an extension of Birchknoll Drive and reconfigured vehicle access from Central Avenue.

The StubHub Center, occupying the western-most 88 acres of the campus, currently includes an existing stadium, and will include additional facilities previously approved as part of the 2010 Campus Master Plan. The proposed project includes the following with respect to the StubHub Center:

- Stadium capacity will be increased by 3,000 seats. Currently, the stadium has seating for 27,000 spectators when configured for the Los Angeles Galaxy Major League Soccer (MLS) games, and will have seating for 30,000 spectators when configured for Los Angeles Chargers National Football League (NFL) games to be held on Sundays through 2020, and for other events; and
- Reorientation of previously approved facilities within the StubHub Center, which were approved as part of the 2010 Campus Master Plan. Specifically, the proposed project includes reorientation of Building 122 - Office Complex and Field House/Training Facility; Building 123 – Dormitories; and Building 124 - Conference Center/Hotel. These proposed facilities were originally aligned in a parallel manner on a site between Victoria Avenue and the soccer stadium. Reorientation of these buildings consists of aligning them perpendicular to Victoria Street, with no change in size, square footage, floor area, height, or overall capacity. Further, these facilities will be located in the same area of the StubHub Center consistent with the 2010 Campus Master Plan.

The project site is the CSUDH campus, located in the City of Carson, in Los Angeles County. The campus consists of approximately 344 acres, and is bounded on the north by Victoria Street, on the south by University Avenue, on the west by Avalon Boulevard, and on the east by Central Avenue. Central Avenue provides access to the campus from the State Route 91 (SR-91) freeway. The campus is surrounded by existing, predominantly single-family residential development to the north across Victoria Street and to the south across University Avenue; residential and commercial development to the west across Avalon Boulevard; and light industrial park facilities to the east across Central Avenue. The surrounding areas are fully developed, with very few vacant undeveloped parcels remaining. Los Angeles County Fire Station 116 is located directly across from the campus on Victoria Street.

Figure 1 shows the regional location of the CSUDH campus (red rectangular area).

Figure 2 is an aerial photo of the existing CSUDH campus with delineations of the University Village, Core Campus and StubHub Center.

Figure 3 shows the 2018 Campus Master Plan.

Figure 2: Existing CSUDH Campus

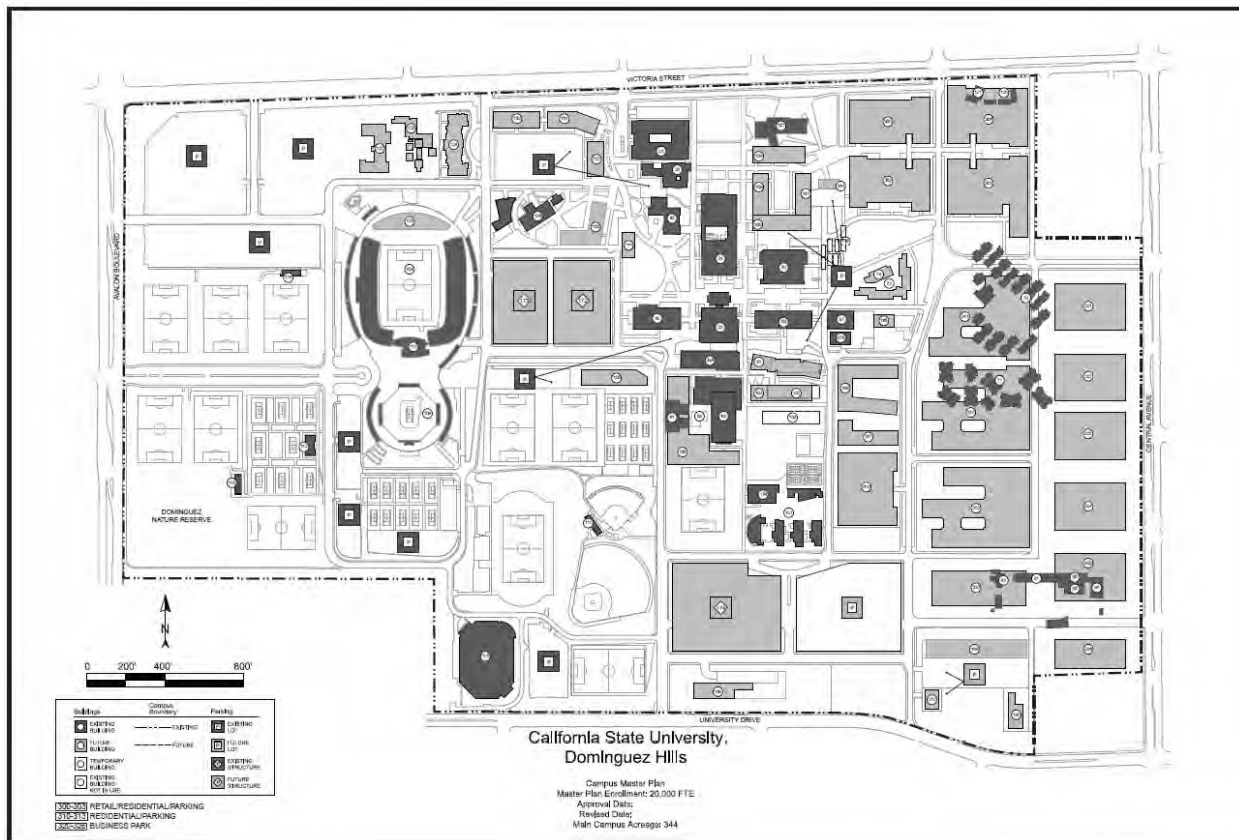

Figure 3: CSUDH 2018 Campus Master Plan

Summary of Existing and Proposed CSUDH Campus Master Plan Facilities

Existing campus facilities excluding student housing occupy 1,408,000 sq ft. Existing student housing provides 649 beds which occupies 165,318 sq ft.

For the Campus Master Plan, total additional square feet of facilities without student and market-rate housing is approximately 1,901,000 sq ft. An estimated 186,000 sq ft of existing facilities will be demolished resulting in a net increase in space of 1,715,000 sq ft.

For the maximum housing alternative, proposed student housing is 2,028 beds or an increase of 1,379 beds over the existing number. The estimated square footage is 1,797,037 sq ft.

For market-rate housing, 1,969 new dwelling units are proposed, which are assumed will be similar to multi-family dwelling units in the Dominguez District.

Senate Bill 610 (Chapter 643, Statutes of 2001) (SB 610) amended state law as of January 1, 2002, to include consideration of water supply availability when cities and counties are making land use development decisions. SB 610 requires information on water supply availability be provided to local public agency decision-makers prior to approval of development projects that meet or exceed any of the following criteria:

1. A residential development of more than 500 dwelling units.
2. A shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet.
3. A commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.
4. A hotel or motel with more than 500 rooms.
5. An industrial, manufacturing or processing plant or industrial park planned to house more than 1,000 persons occupying more than 40 acres of land or having more than 650,000 square feet of floor area.
6. A mixed-used project that includes one or more of the projects specified above.
7. A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

The proposed Campus Master Plan exceeds criteria 6.

This WSA assesses the adequacy of the water supply to meet the estimated demands of the proposed CSUDH CMP over the next 20 years and those of the Dominguez District customers and projected new users under normal, single dry year and multiple dry year conditions (Water Code §10911(a)). SB 610 requires that the information presented in a WSA be included in the administrative record that is the basis for an approval action by the local public agency.

SB 610 recognizes local control and decision-making regarding availability of water for projects and approval of projects. A WSA is to be provided for inclusion in environmental documentation for projects subject to the California Environmental Quality Act (as defined in Water Code 10912 [a]).

The CSUDH CMP is not specifically included in Cal Water's Dominguez system 2015 Urban Water Management Plan (UWMP); therefore, its water requirements are addressed in this WSA. The 2015 UWMP is based on data recorded through 2015. Cal Water has collected and compiled data on population growth, water demand and water supplies from 2016 to September 2018. These data have been used in this WSA. The Dominguez District 2015 UWMP document can be referenced for more detailed information on historic water demand and supply. In June 2009, Cal Water completed a Water Supply and Facilities Master Plan (WSFMP) for the Dominguez District that also included an assessment of future water demand and supply that was used in preparing the 2015 UWMP.

CSUDH CMP Water Demand

Cal Water currently provides potable and recycled water services to CSUDH. Potable water is supplied for all campus uses except landscape irrigation. Irrigation water is recycled water provided by West Basin Municipal Water District and is delivered to the campus through a separate piping system. The Campus Master Plan will continue to use recycled water for landscape irrigation.

There are 8 separate metered water service connections from Cal Water's Dominguez District distribution system to the existing CSUDH campus. For the 4 years from 2015 through 2018, the average daily water metered use for the entire campus was 232,968 gallons/day (gpd). Generally,

student housing water use is higher than other campus building uses. Here, a factor of 1.5 is used.

The following equation was used to derive existing campus average daily water use expressed in gpd per sq ft or gpd/ft²:

x = Existing CSUDH campus average water use rate - gpd/ft²

$$1,408,000 \text{ ft}^2 (x) \text{ gpd/ft}^2 + 1.5 (165,318) \text{ ft}^2 (x) \text{ gpd/ft}^2 = 232,968 \text{ gpd}$$

$$x = 0.14068 \text{ gpd/ft}^2$$

For the proposed MCP, it is conservatively assumed that for non-housing facilities there will be a 10% reduction in the average daily use rate.

A review of literature on water use by fixtures and appliances shows that toilets 15 years and older generally exceed 2 gallons per flush. More recent toilets use 1.6 gallons per flush. The latest water efficient toilets use only 0.6 gallons per flush. Depending on the reference toilet, the latest toilets achieve 62.5% to 70% reduction in water use compared to older versions. New efficient dishwashers use between 4.5 and 7 gallons per wash load compared to older machines, which use between 7 and 14 gallons per wash load. Using 10.5 gallons per load for older machines and 5.75 gallons per load for newer water efficient machines results in an average savings of 4.75 gallons per load or a reduction in water use of 45%. Showers with restricted flow heads have an average flow rate of 2.0 gallons per minute (gpm) versus conventional shower head flows of 2.5 gpm or a 20% reduction. Washing machines 20 years or older used 40 gallons per standard load versus new machines using 13 gallons per load or a reduction of 67.5%.

For 2020, the Dominguez 2015 UWMP projects 16,876 multi-family dwelling units with an average number of persons per unit of 3.13, which totals 52,822 persons. Projected 2020 water use for multi-family dwelling units is 2,111,335 gpd. Therefore, estimated average per capita water use for multi-family dwelling units in the Dominguez District is 40 gpd/person.

Estimated Campus Master Plan average daily water use at build-out:

1) *Market Rate Dwelling units:*

Assuming an occupancy rate of 3.0 persons per dwelling unit for the proposed new dwelling units in the MCP, results in the following demand estimate at build out:

$$1,969 \text{ dwelling units} \times 3.0 \text{ persons} \times 40 \text{ gpd/person} = 236,280 \text{ gpd}$$

2) *Non-Housing Facilities:*

$$1,715,000 \text{ ft}^2 (0.9) (0.14068 \text{ gpd/ft}^2) = 217,140 \text{ gpd}$$

3) *Student Housing:*

Assuming student housing has the same per capita water use as the market rate dwelling units

results in the following demand estimate at build out:
2,028 beds or persons x 40 gpd/person = 81,120 gpd

Total estimated water use: 534,540 gpd

The estimated increase in average daily water use is: 534,540 – 232,968 = 301,572 gpd or 338 Acre-Feet/Year (AFY)

California Water Code 10631, Paragraph (e) (2), requires a potable water use projection (average annual demand forecast) in five-year increments for a 20-year period. The CSUDH CMP demand forecast in 5-year increments for the next 20 years is shown in Table 1.

Table 1: CSU Dominguez Hills CMP Forecasted Increased Demand (AF)					
Year	2020	2025	2030	2035	2040
Demand	0	120	180	338	338

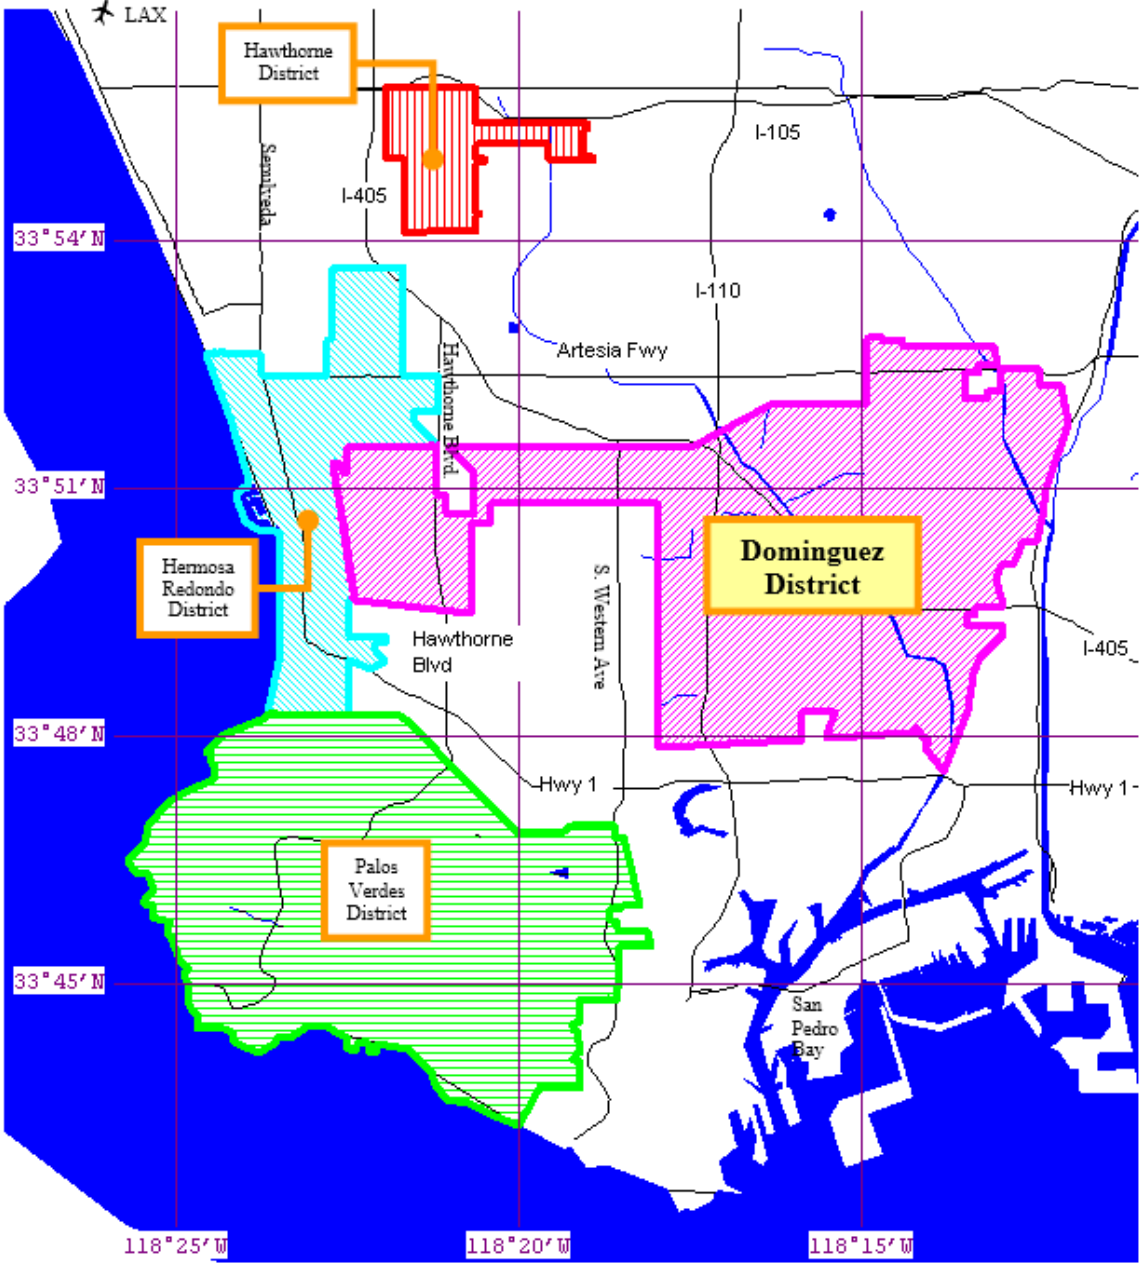

Dominguez District Background Information

The Dominguez District is located in the southern corner of Los Angeles County approximately ten miles north of Los Angeles Harbor. The Dominguez District is one of three Cal Water districts in close proximity. The other two are the Hermosa Redondo and the Palos Verdes Districts. Cal Water also is under contract to operate the Hawthorne District, and has various operations and billing contracts.

The Dominguez District serves most of the City of Carson, as well as a portion of the City of Torrance and small sections of the cities of Compton, Long Beach and Los Angeles and unincorporated Los Angeles County. The district covers approximately 35 square miles and is bounded on the north by the cities of Redondo Beach, Torrance, Los Angeles, Carson and Compton, on the east by Long Beach, on the south by the cities of Los Angeles, Lomita and Torrance, and on the west by Redondo Beach.

Figure 4 shows the location of the Dominguez District.

Figure 4: Location of the Dominguez District

Cal Water started providing water utility services in the Dominguez District in 2000. Water served by the District comes from a combination of local groundwater and surface water purchased from Central Basin Municipal Water District (CBMWD) and West Basin Municipal Water District (WBMWD), which is imported from the Colorado River and the State Water Project. Recycled water is also used within the district. The district owns 392 miles of pipeline, nine active wells, 12 storage tanks, and seven imported water connections. For the period from

2010 to 2015 the District delivered an average of 29 million gallons per day (mgd) to over 32,000 service connections.

A detailed service area map is provided in Appendix E of the 2015 Dominguez Urban Water Management Plan (UWMP).

Cal Water estimates the district population was 142,227 in 2015. District population has been growing slowly at an annual rate of 0.13 percent for the past 15 years. Between the 2000 and 2010 Censuses, it grew at an average annual rate of 0.11 percent. Service area population is projected to increase at a rate of 0.28 percent annually through the 2040 planning horizon. This is based on the 15-20 year historical rate of growth in single- and multi-family housing units in the District.

To estimate current service area population, Cal Water uses MARPLOT and LandView 5 software to intersect District service area boundaries with Census Blocks from the 2000 and 2010 Censuses. This yields estimates of the number of housing units and population within each Census Block in the District for 2000 and 2010. From these data, Cal Water estimates the total population and the average number of persons per housing unit in the District. Cal Water applies the average number of persons per housing unit to the number of housing units served to calculate service area population in non-Census years.

Between the 2000 and 2010 Censuses, the average number of persons per household remained unchanged at 3.13. The projection of future population is based on this housing unit density. Projected service area population is given in Table 2.

Table 2: Dominguez District Population Projections						
Persons	2015	2020	2025	2030	2035	2040
	142,227	144,201	146,202	148,230	150,287	152,372

Cal Water’s user classes for customer services are as follows:

- ◆ Single-family Residential
- ◆ Multi-family Residential
- ◆ Commercial
- ◆ Industrial
- ◆ Government
- ◆ Other

Figure 5 shows the distribution of services by customer type based on 2015 data.

Figure 5: Dominguez District Distribution of Services (2015)

Dominguez District Water Demand

Actual water demand from 2010 to 2017 is shown in Table 3. The reduction in demand that occurred in 2016 and 2017 was due to the severe drought that started in 2012 and the 2016 state mandatory requirement that all urban areas achieve at least a 20% reduction in water demand compared to an earlier base period.

Table 3: Dominguez District Actual Water Demand	
Year	AFY
2010	33,020
2011	31,672
2012	33,348
2013	33,905
2014	33,863
2015	31,316
2016	29,250
2017	28,836

Projected potable water demands by customer category through 2040 are shown in Table 4. Future demands are estimated as the product of future services and expected water use per service. Future services are based on historical growth rates in the District. Single-family

residential services are projected forward using the historical growth rate for the last 15 years while multi-family residential services are projected using the last 20 years. Commercial and industrial services are projected forward using the historical growth rate for the past 20 and 15 years, respectively. The forecast assumes no change in the number of institutional services. The projected average annual growth rate in services across all customer categories is approximately 0.3 percent. Table 5 presents the projected potable and recycled water use for the district.

Expected water use per service, shown in Figure 6, is based on weather-normalized historical use, adjusted for future expected water savings from plumbing codes and District conservation programs. Weather normalization of historical use was done econometrically using the California Urban Water Conservation Council GPCD Weather Normalization Methodology. Expected water savings from plumbing codes are presented in Section 4.4 of the 2015 UWMP. Expected water savings from District conservation programs and projected compliance with the District’s SB X7-7 2020 per capita water use target are covered in Chapter 9 of the 2015 UWMP.

Projected water demands in Table 4 are based on unrestricted demands under normal weather conditions.

Figure 6: Historical and Projected Average Use per Service in Gallons per Day

Table 4: Dominguez Projected Potable Water Demand					
Use Type	(AF)				
	2020	2025	2030	2035	2040
Single Family	9,507	9,439	9,450	9,484	9,542
Multi-Family	2,365	2,289	2,249	2,223	2,207
Commercial	7,070	7,002	7,017	7,031	7,053
Industrial	10,444	10,558	10,680	10,805	10,933
Institutional/Governmental	1,492	1,484	1,478	1,473	1,469
Other	108	113	118	123	129
Losses	520	527	535	543	551
Total	31,508	31,413	31,528	31,683	31,883

Cal Water purchases recycled water from West Basin Municipal Water District (WBMWD) and provides it to a number of customers for non-potable uses, thereby reducing use of potable water. The projections of future water demand in Table 5 incorporate expected water savings from plumbing codes and appliance standards for residential and commercial toilets, urinals, clothes washers, dishwashers, and showerheads. The Dominguez District’s program and implementation of demand management measures (DMM) are discussed in Chapter 9 of the UWMP.

Projected total water demand including recycled water is shown in Table 5. Current and projected recycled water use is discussed in Section 6.5 of the 2015 UWMP. Table 5 does not include recycled water that is injected into the groundwater system for recharging aquifers that are pumped for potable supply – indirect potable reuse (IPR). This amount is projected to be a constant 3,288 AFY.

Table 5: Dominguez Projected Total Water Demands (AF)						
		2020	2025	2030	2035	2040
Potable Water		31,508	31,413	31,528	31,683	31,883
Recycled Water		7,950	8,800	9,700	10,700	11,800
Total Water Demand		39,458	40,213	41,228	42,383	43,683

The estimated increase in CSUDH CMP potable water demand at build out in 2035 is 338 AFY or 1.0% of projected 2035 and 2040 Dominguez District demand. In 2025, CSUDH CMP increase in demand is 0.38% of Dominguez District demand. Conservatively, the estimated increase in CSUDH CMP demand is added to the projected Dominguez District demand in Table

4 resulting in the demand projections in Table 6.

Table 6: Projected Dominguez District + CSUDH CMP Increase Potable Water Demand (AF)						
		2020	2025	2030	2035	2040
Dominguez District		31,508	31,413	31,528	31,683	31,883

Total Demand		31,508	31,533	31,708	32,021	32,221

Demand Management Measures

A summary of Dominguez District current and planned demand management measures (DMM) and an overview of the expected water savings and compliance with the Water Conservation Act of 2009 (SB X7-7) follow.

DMM categories in Section 10631(f) of the UWMP Act consist of:

- Water waste prevention ordinances
- Metering
- Conservation pricing
- Public education and outreach
- Distribution system water loss management
- Water conservation program coordination and staffing support, and
- Other demand management measures

Water Waste Prevention Ordinances

Water use restrictions are authorized by the California Public Utilities Commission (CPUC) Rule 14.1 or Schedule 14.1. Restrictions are also regulated by ordinances passed by local governments. In the Dominguez District the cities of Carson and Torrance have passed water conservation ordinances. They are included in Appendix J of the 2015 UWMP. Schedule 14.1 puts measures in place to enable Cal Water to enforce the water-use prohibitions set by the State Board, including:

- Applying water to outdoor landscapes that causes runoff onto adjacent property, non-irrigated areas, private and public walkways, roadways, parking lots, or structures
- Using a hose to wash motor vehicles unless the hose is fitted with a shut-off nozzle or device that causes it to cease dispensing water immediately when not in use
- Applying water to driveways and sidewalks
- Using water in a fountain or other decorative water feature, except where the water is part of a recirculating system

- Applying water to outdoor landscapes during and within 48 hours after measurable rainfall
- Using potable water to irrigate outside of new construction without drip or microspray systems
- Using potable water on street medians
- Filling or refilling ornamental lakes or ponds except to sustain existing aquatic life
- Customers must fix leaks within their control within five business days of notification
- Hotel/motel operators must provide option to not have towels or linens laundered daily during a guest’s stay, and must provide clear notice of this option in easy-to-understand language
- Restaurants and other eating and drinking establishments may only serve drinking water upon request

Beginning June 1, 2015, individual customers were provided water budgets based upon their water use each month in 2013 minus the state-mandated reduction for the Dominguez District of 16%. If a customer used less than his or her water budget, the unused water was carried forward, similar to rollover minutes on a cell phone plan. Water used in excess of the monthly budget was subject to a drought surcharge

Metering

All service connections within the Dominguez District are metered. Meters are read monthly and routinely maintained and calibrated. Customers are billed monthly based on their metered water use.

Cal Water is also piloting automatic meter reading (AMR) and advanced metering infrastructure (AMI) in several of its districts. AMI may be used by Cal Water in the future to detect and alert households of leaks and other possible problems as well as to provide customers with tailored water use information to help them use water more efficiently.

Conservation pricing

Starting in 2008 Cal Water adopted tiered rate designs for single family residential service. Uniform volumetric rate designs are employed by Cal Water for other water service classes. Current volumetric rates by class of service within Dominguez District are provided in Table 7.

Table 7: Volumetric Water Rates by Class of Service (\$/CCF)				
Class of Service	Tier 1 (1-11 ccf)	Tier 2 (12-17 ccf)	Tier 3 (18+ ccf)	All units of water
Single Family	\$2.87	\$3.11	\$3.63	
Non Residential				\$3.13

Per the Memorandum of Understanding Regarding Urban Water Conservation in California (MOU), conservation pricing provides economic incentives to customers to use water efficiently via a volumetric water rate. The MOU considers uniform, seasonal, tiered (block), and allocation-based rate designs as each being potentially consistent with conservation pricing,

provided that either (1) 70% or more of total annual revenue is derived from the volumetric component of the rate design or (2) the proportion of total revenue from the volumetric component of the rate design equals or exceeds the long-run incremental cost of providing water service, or (3) the utility's metering technology, rate structure, and customer communication programs satisfy various requirements specified by the MOU.

The Dominguez district's rate structure complies with Option 1 of the Urban MOU's definition of conservation pricing. Urban MOU BMP compliance reports are provided in Appendix L of the 2015 UWMP.

Public Education and Outreach

Cal Water's public outreach program is divided into four components, as follows:

Residential Customer Assistance – This category provides tailored assistance to residential customers through home water surveys and monthly water use reports. It provides assistance to residential customers wanting to reduce their indoor and outdoor water uses. While available to all residential customers, marketing of home water surveys is generally focused on high use residential customers.

Non-Residential Customer Assistance – This category provides tailored assistance to commercial customers through commercial water surveys, monthly landscape reports to large landscape customers, and large landscape water use surveys. It provides assistance to commercial customers wanting to reduce their use of water for sanitation, hygiene, process, and landscape purposes.

Public Information and School Education – Cal Water's public information program provides general information on the need for and value and methods of water conservation through multiple media outlets, including its website, direct mail, external print media, and radio. Cal Water's school education program includes the Cal Water H2O Challenge, a project-based learning competition for grades 4-6, Cal Water Town, an interactive online learning tool, and general information and learning materials for students and teachers.

Rebate Program Information and Marketing – Through its website, bill inserts, newsletters, and radio and print media, Cal Water advertises and markets a variety of conservation rebate programs, including rebate programs for high-efficiency toilets, urinals, and clothes washers, and irrigation equipment and landscape efficiency improvements.

Programs to Assess and Manage Distribution System Loss

Cal Water annually quantifies the District's volume of apparent and real water losses. Cal Water uses the AWWA water audit method and component analysis. For the five-year period 2011-2015, apparent and real water loss in the Dominguez District averaged 594 AF.

Cal Water is implementing a lift-and-shift sonic data logger leak detection program which will survey up to one-third of main miles annually in three 80 day shifts. Lift-and-shift sonic data logging technology will enable Cal Water to quickly and efficiently locate leaks in one part of the water distribution network and then redeploy the equipment to another part of the network. Staff will review sound files from the loggers for potential leak warnings and discuss this information with District management, who can then assign work orders for repair crews to

investigate and repair leaks. Cal Water conservatively estimates the lift-and-shift program will reduce real water loss in the District by up to 29 AFY.

Water Conservation Program Coordination and Staffing Support

Conservation program staffing positions must be approved by the CPUC through its General Rate Case every three years. Currently authorized conservation program staffing consists of five full-time positions, which include:

- A Conservation Program Manager
- A Conservation Program Analyst
- A Landscape Program Analyst
- Two Conservation Program Coordinators

These five staff positions manage all aspects of Cal Water's conservation programs deployed across 24 separate districts serving a combined population of about 2 million through 470,000 service connections. Staffing constraints have been one of the primary challenges Cal Water has faced in expanding the scope and reach of its conservation programs throughout its service districts. To ensure adequate management and oversight of the expansion and utilization of its conservation programs, Cal Water is proposing in its current General Rate Case to add three additional Conservation Program Coordinator positions. If approved, total staffing level would increase from 5 to 8 FTE positions.

Other Demand Management Measures

Cal Water has rebate, give-away, and direct installation programs aimed at plumbing fixture replacement and irrigation equipment and landscape efficiency improvements. Following are brief descriptions of each of these DMMs.

MaP Premium and Non-Premium Toilet Replacement – This program replaces old toilets with MaP certified high-efficiency toilets. Financial rebates, direct installation, and direct distribution are used to deliver toilets to customers. For residential customers, MaP premium certified toilets which have greater water savings potential are eligible for a \$100 rebate while the rebate for MaP non-premium toilets is \$50. For commercial customers, a rebate of \$100 is available for valve-type toilets flushing 1.28 gallons or less and EPA WaterSense labeled tank-type toilets. Cal Water centrally administers the program. This program is available to all residential and non-residential customers. Cal Water markets the program through direct mail, print media, bill stuffers, and its website. Where advantageous, Cal Water partners with local or regional agencies and community organizations to offer the program.

Urinal Valve and Bowl Replacement – This program replaces old urinals with high-efficiency urinals meeting the new 0.125 gallon per flush water use standard adopted by the California Energy Commission in April 2015. Financial rebates of up to \$150 are available to customers. The program targets offices and public buildings receiving significant foot traffic. Cal Water centrally administers the program. While this program is available to all non-residential customers, marketing focuses on prime targets, such as restaurants and high-density office buildings. Cal Water markets the program through direct mail, print media, bill stuffers, and its website.

Clothes Washer Replacement – This program provides customer rebates up to \$150 for residential and up to \$200 for non-residential high-efficiency clothes washers. The program targets single-family households, multi-family units, multi-family common laundry areas, and commercial coin-op laundries. Cal Water centrally administers the program, and markets the program through direct mail, print media, bill stuffers, and its website. This program is available to all residential and non-residential customers. Where advantageous, Cal Water partners with local or regional agencies to offer the program.

Residential Conservation Kit Distribution – This program offers Cal Water residential customers conservation kits featuring a range of water-saving plumbing retrofit fixtures. Kits are available at no charge to customers, who can request them via Cal Water’s website, via mail, or by contacting or visiting their District. Each kit includes the following items: high-efficiency showerheads, kitchen faucet aerator, bathroom faucet aerators, full-stop hose nozzle, and toilet leak detection tablets. Cal Water centrally administers this program as part of a company-wide program operated in each of its districts. This program is available to all residential customers. Cal Water markets the program through direct mail, print media, bill stuffers, and through its website.

Smart Controllers Rebates/Vouchers – This program targets residential and non-residential customers with high landscape water use. The program offers financial incentives up to \$125 for residential controllers and up to \$25 per station for commercial-grade controllers to either the customer or contractor for proper installation of the Smart Controller at customer sites. The landscape contractor has the direct relationship with customers and is typically the entity customers listen to when making landscape and irrigation decisions. The program educates contractors about the customer benefits of Smart Controllers along with proper installation of the devices. This program is offered to all residential and non-residential customers. Cal Water markets the program through direct mail, print media, bill stuffers, and its website.

High Efficiency Irrigation Nozzle Web Vouchers/Rebates – Water efficient sprinkler nozzles (popup and rotating) and integrated pressure-regulated spray bodies use significantly less water than a standard sprinkler head by distributing water more slowly and uniformly to the landscape. In addition to reducing water use, water directed from these nozzles reduces run-off onto streets and sidewalks with a more directed flow. Customers are able to obtain the nozzles and spray bodies either directly through Cal Water or via a web-voucher program. Restrictions on the number of nozzles individual customers may receive vary by customer class and/or landscape size. Cal Water centrally administers this program as part of a company-wide program operated in most of its districts.

Turf Buy-Back – This program offers customers a \$1 per square foot rebate to replace turf with qualified drought-tolerant landscaping. Customer applications are screened to ensure program requirements are met, including before and after photos of the retrofitted landscape area. Turf replacement rebates were offered in a subset of Cal Water districts starting in 2014 and offered across all districts starting in 2015 as a drought response measure. Governor Brown’s Executive Order B-29-15 calls on the Department of Water Resources to lead a statewide initiative, in partnership with local agencies, to replace 50 million square feet of lawns and ornamental turf with drought tolerant landscapes.

Implementation of DMMs from 2011 to 2015 is summarized in Table 8. Estimated annual and cumulative water savings is shown in the last row of the table. The water savings estimates do not include those from water waste prevention ordinances, conservation pricing, general public information, or distribution system water loss management.

Significant additional reductions in water demand were achieved in 2015 in response to the the District’s drought response measures, including its public information campaigns to save water and its Schedule 14.1 water use restrictions, water budgets, and drought surcharges that went into effect June 1, 2015. Relative to its 2013 reference year under the State Board’s Emergency Regulation for Statewide Urban Water Conservation, water demand between June and December 2015 decreased by 17.9 percent. Per capita potable water use in 2015 was 176 GPCD compared to the District’s SB X7-7 2015 interim water use target of 194 GPCD.

Table 8: Dominguez District Results of Implementation of DMMs: 2011-2015		
1. Plumbing Fixture Replacement	2011 – 2015 Total	Average Annual
Toilets & Urinals (number distributed)	6,223	1,245
Clothes Washers (number distributed)	476	95
Conservation Kits (number distributed)	4,927	985
2. Irrigation Equipment/Landscape Upgrades		
Smart Controllers (number distributed)	41	8
Nozzles & Spray Bodies (number distributed)	47,128	9,426
Turf Buy-Back (sq ft removed)	2,249	450
3. Residential Customer Assistance		
Surveys/Audits (homes receiving)	254	51
4. Non-Residential Customer Assistance		
Surveys/Audits (sites receiving)	11	2
Large Landscape Reports (sites receiving)	366	73
Estimated Water Savings (AF)	1,061	212

Projected SB X7-7 compliance water use for Dominguez District in 2020 under planned levels of DMM implementation is 195 GPCD compared to its target water use of 173 GPCD. On its own, Dominguez District is not expected to be able to meet its 2020 GPCD target. However, SB X7-7 allows water suppliers to form regional alliances and set regional targets for purposes of compliance. Under the regional compliance approach, water suppliers within the same hydrologic region can comply with SB X7-7 by either meeting their individual target or being part of a regional alliance that meets its regional target. The regional target is calculated as the population-weighted average target for the water suppliers comprising the regional alliance. The Dominguez district has formed a regional alliance with Cal Water’s four other Southern California water districts. Projected 2020 potable water demand for the regional alliance under planned levels of DMM implementation is 163 GPCD compared to a regional alliance target of 161 GPCD. While projected 2020 potable water use exceeds the regional target, the target is

within the margin of error for the forecast and therefore the likelihood the regional target will be achieved is high.

Water Conservation Master Plans

To comply with requirements for urban water use reduction, Cal Water developed Water Conservation Master Plans (WCMP) for each of its service districts. WCMPs set forth a framework for compliance and describe Cal Water’s specific conservation actions to be implemented in the next five years. Major tasks in the WCMPs include:

1. A complete review of State policies and development of a compliance strategy
2. Calculating all appropriate per capita targets
3. Determining water savings required from new programs
4. Performing an analysis of conservation programs
5. Developing a portfolio of conservation program actions
6. Creating a plan for monitoring and updating the WCMP

The Water Conservation Master Plan for the Dominguez system is in Appendix L in the Dominguez District 2015 UWMP.

Water Shortage Allocation Plans

Cal Water has also developed Water Shortage Allocation Plans (WSAP), which are plans of action to reduce water demand should significant water supply shortages occur. These actions may be implemented for several months or several years depending on circumstances. The WSAP differs from the WCMP, which is focused on achieving permanent reductions in per capita water use by Cal Water’s customers and is not driven by significant short or long reductions in supply. In the short-term, the WSAP assists Cal Water in further reducing demand so that it matches significant reductions in supply.

Implementation of Cal Water’s WSAP for the Dominguez system will generally be triggered by actions taken by WBMWD and the Metropolitan Water District (MWD). Except in unusual circumstances, Cal Water will follow the lead of these agencies when deciding whether to implement its WSAP. Cal Water has a four-stage approach that corresponds to specific levels of projected water supply shortage. Depending on the supply reduction target, this approach becomes increasingly more aggressive in requiring customer water use reductions. The stage selected depends on such factors as wholesale supply reductions, availability of alternative supplies, time of year and coordinated regional actions among all affected water utilities and agencies.

The percentage of supply shortage determined by MWD will be a significant factor in Cal Water’s decision on which stage of supply reduction it will implement for the Dominguez system. Supply reductions percentages are shown for each of the 4 stages in Table 9.

Table 9: Cal Water Supply Shortage Reduction Stages	
Stage	Projected Supply Reduction %
Stage 1	5 to 10%
Stage 2	10 to 20%
Stage 3	20 to 35%
Stage 4	35 to >50%

A description of each stage follows.

Stage 1 is for water supply shortages of up to 10 percent and can be used to address annual variations in precipitation and mild dry year periods of one or two years duration. All reductions in Stage 1 are voluntary and impacts to customers are considered minimal.

Stage 2 is based on projected water supply shortages between 10 and 20 percent. Stage 2 is for water shortages of moderate severity such as those caused by a multi-year dry period. Reductions by customers can be voluntary or mandatory depending on percentage of water shortage. Mandatory requirements would likely be implemented if supply shortage exceeds 15 percent. Customers will experience moderate impacts on normal water use and some businesses may experience financial impacts.

Stage 3 will be activated if there is a water supply reduction between 20 and 35 percent. This stage can be triggered by a very severe multi-year dry period or major failures in facilities for storage, transmission, treatment water and distribution facilities due to a natural disaster such as an earthquake. Supply reduction of these percentages could impact public health and safety and cause significant financial impacts on local businesses. All reductions are mandatory and customer allocations will be made.

Stage 4 would be triggered by a reduction of supply greater than 35 percent, and possibly above 50 percent. This would be a crisis caused by a most severe multi-year dry period, a severe natural disaster resulting in catastrophic failure of major water supply infrastructure.

Cal Water's groundwater supply from the Central and West Basins is limited to its APA of 16,897 AFY, which is based on the safe yield of each basin and is fixed in both wet and multiple dry year periods. After Dominguez system well pumping capacity is increased to sustainably produce the APA, groundwater supply can be used to offset reductions in imported water from WBMWD. Recycled water is a drought-proof supply not subject to reductions by WBMWD. During critical water shortage periods, Cal Water will maximize recycled water use with existing customers and work on increasing use by additional customers in order to reduce potable water demand.

In April of each year, MWD assesses its available water supply for the coming water year and determines if reductions in water use by its member agencies are not required, are advisable or are in fact needed. MWD evaluates the performance of WBMWD retailers as a whole and will only assess penalties to WBMWD if retailers' collective use exceeds its allocation. These reduction targets are passed along through WBMWD to Cal Water and from Cal Water to its customers. If requested by MWD, the allocation period begin on July 1st and continues for at least one year or until the availability of supplies warrants the lifting of requesting water use reductions.

During all stages of water shortages, water production data for all sources are monitored by Dominguez system management. Customer water use data is concurrently monitored to determine if demand reduction percentages are being achieved and, if not, which customers require greater attention by Cal Water.

Dominguez District Water Supply

Information from the 2015 UWMP and more recent data on potable and recycled water use through 2017 was used to develop the supply plan for the Dominguez District to 2040.

Following are the Dominguez District's water supply sources:

- Imported water purchased from Metropolitan Water District of Southern California through the West Basin Municipal Water District.
- Groundwater pumped from two adjudicated groundwater basins - the West Coast Basin and the Central Basin. Groundwater is extracted from both basins using 10 wells (8 active and 2 inactive).
- Cal Water purchases treated desalted brackish groundwater produced in the C. Marvin Brewer Desalter owned by West Basin Municipal Water District.
- Recycled wastewater produced by the West Basin Municipal Water District in their West Basin Water Recycling Plant located in El Segundo.

In 2015, the Dominguez District used 26,908 AF of purchased water and 4,408 AF of groundwater pumped from Cal Water wells for a total of 31,316 AF of potable water. Hence, groundwater supplied 14.1% of total annual demand. In 2017, the district had a total potable supply of 28,836 AF of which 15% or 4,325 AF were pumped groundwater.

For the period from 2011-2015, the average of the three principal potable and recycled water sources was 68% purchased, 17% groundwater and 15% recycled (non-potable).

Total supply quantities equal the projected total demand for potable and recycled water. Cal Water operates its potable water distribution system so that demand not met by groundwater sources is met by potable water conveyed through its interconnections with the WBMWD transmission system.

Cal Water has a capital improvement program to construct new wells and install treatment facilities on existing wells with non-compliant water quality in order to achieve full use of its adjudicated groundwater rights. The plan is to provide sufficient well capacity to fully utilize its annual allocation of groundwater. Currently, Cal Water leases a portion of its groundwater rights using short-term transfer agreements. Purchased water has and will continue a major source of the District's potable supply. Recycled water supply equals projected demand for non-potable uses in the District.

Purchased Water

Purchased potable water is imported and supplied by MWD to WBMWD. Historically, purchased water has been the main supply source. In 2020, groundwater is projected to provide 38.8% and in 2025, 53.8% of potable supply. The challenge has been and continues to be finding suitable well sites from which high quality water can be pumped. If water quality is non-compliant with drinking water standards then Cal Water must also provide treatment facilities at the well site.

Water from MWD is delivered through four interconnection feeders (Palos Verdes Feeder, Victoria Feeder, Long Beach Lateral and Extension and the Sepulveda Feeder) to WBMWD and through seven WBMWD service connections to the Dominguez District. The total rated capacity of the seven service connections is 72,000 gpm. If operated at full capacity, these connections are capable of delivering up to 103.7 mgd (116,140 AFY) – a flow rate higher than the distribution system could accommodate.

Cal Water has a supply purchase agreement with WBMWD. Water purchased by Cal Water and supplied to the Dominguez District comes from either the Colorado River Aqueduct, which is owned by MWD, or through the California Aqueduct, a facility of the State Water Project (SWP), which is owned and operated by the California Department of Water Resources (DWR).

MWD classifications of service and rate structure have changed in recent years and further changes are anticipated. Key to these changes is a purchase agreement for imported water between WBMWD and MWD. This agreement became effective January 1, 2003, had an initial term of five years, and establishes requirements for water sales within MWD's service area. The agreement sets a Base Allocation for each Purchaser, which is essentially their share of the supply MWD has made available to WBMWD. The Base Allocation is determined on that Purchaser's five-year average non-surplus purchases during fiscal years ending 1997 through 2001. Over the term of the agreement, the Purchaser commits to purchase at least 60 percent of the Base Allocation times five, which is known as the Purchase Commitment. If a Purchaser does not purchase the full Purchase Commitment over the term of the agreement, then they must pay for the balance at the current Tier 1 Supply Rate.

A two-tier rate and annual allocation is another aspect of this agreement. The agreement sets a Tier 1 Annual Maximum at 90 percent of the Base Allocation. All water purchased in any year in an amount that is equal to or less than the Tier 1 Maximum will be purchased at the current Tier 1 Rate. Any amount of water purchased in excess of the Tier 1 Annual Maximum will be at the Tier 2 Rate. In 2013, the Tier 1 rate for water purchased from WBMWD was \$1,089/AF and the Tier 2 rate was \$1,239/AF.

In the Imported Water Purchase Agreement between Cal Water and WBMWD, the Base Allocation, Tier Allocations, and Purchase Commitment are established as a combined amount for the three Cal Water districts (Palos Verdes, Hermosa-Redondo, Dominguez) and the Hawthorne service area. The Dominguez District shares in the combined amount with the other three service areas. The agreement became initially effective on January 1, 2003. There have been several subsequent amendments, with No. 4 dated January 1, 2008, being the most recent. It eliminated Cal Water's Base Allocation, set the Tier 1 Annual Maximum to 70,000 acre-feet and the Purchase Commitment is 210,000 acre-feet. Cal Water has developed an allocation that distributes the Tier 1 Annual Maximum to each of its four districts, so that if the total Tier 1 Maximum is exceeded the applicable Tier 2 charges can be assessed to the appropriate district. Allocations among the four districts are as follows: Dominguez 22,400 AF, Hawthorne 4,900 AF, Hermosa-Redondo 16,800 AF, and Palos Verdes 25,900.

In-Lieu Seasonal Storage is an economic incentive program designed to encourage purveyors to shift groundwater production from winter to summer to reduce peak summer demands. Seasonal Storage Service is a classification for water that is available for delivery by MWD during the October through April period during years of adequate supply. Monthly certification is required to receive this reduced-price Seasonal Storage Service.

To qualify for In-Lieu Seasonal Storage service water rates, a purveyor must reduce demand for supplemental water from MWD in the summer months (May to September) and shift production of groundwater from winter to summer. The baseline production ratio between local groundwater supply and total demand verifies that this shift has been accomplished. In-Lieu Seasonal Storage groundwater not pumped is left in the ground to augment groundwater replenishment. This unused groundwater results in a rebate or compensation from the Water Replenishment District (WRD) for the amount not pumped.

This program benefits MWD by reducing the summer peak flows that push MWD's treatment facilities and distribution system to capacity limits, and enables MWD to maximize water importation during winter when surplus flows are abundant in the areas of origin. Changes are

anticipated in this conjunctive use program in the future. Cal Water's participation in this conjunctive use program will depend on the makeup of the economic incentives provided by these changes.

Groundwater

In 1965 the Central Basin was adjudicated, and in 1961 the West Coast Basin was adjudicated, with the Department of Water Resources as Watermaster. The adjudication orders are attached to the Dominguez District 2015 UWMP as Appendices J and K for each basin, respectively. The DWR Annual Summary of Watermaster Service reports on groundwater status in each of the basins. This summary includes historical fluctuation of water level elevation in wells throughout the basin. These references indicate that, since the reduction in pumping began in 1954 and the adjudication was implemented in 1961, groundwater levels in the West Coast Basin have risen some 20 to 60 feet, depending on location. However, many groundwater elevations in the basin remain below sea level, requiring maintenance of seawater intrusion barriers.

The West Coast Basin is a pressurized aquifer groundwater basin with three primary aquifers: the 200-foot Sands, the Silverado Aquifer, and the Lower San Pedro Aquifer. These aquifers have continuity with the Pacific Ocean in Santa Monica Bay. Overdraft of the basin was caused by excessive pumping due to population growth and rapid industrialization of the Los Angeles Coastal Plain beginning in the 1930s. This overdraft caused lowering of the piezometric head of the aquifers, which increased pumping cost and resulted in seawater intrusion. The adjudication of the West Coast Basin began in 1945 when Cal Water, along with the City of Torrance and the Palos Verdes Water Company, filed a lawsuit in Superior Court, Los Angeles County, to quiet title to the groundwater rights and control pumping in the basin. As part of the effort to resolve the overdraft condition, the WBMWD was formed in 1947 to distribute supplemental water to the major water purveyors imported into the region by the MWD. In 1955 when pumpers realized the severity of the overdraft, groundwater pumping was limited under an interim agreement. In 1961, the Court rescinded the interim agreement and signed the West Coast Basin Judgment.

The Dominguez Water Company was identified as a party to the judgment and granted water rights. Now Cal Water, as a result of the merger with Dominguez, owns 10,417.45 acre-feet of adjudicated rights in the West Coast Basin, or 16.15 percent of the total basin annual adjudicated rights of 64,486.25 acre-feet. This amount is in addition to the 4,070 acre-feet held by Cal Water's Hermosa-Redondo District. As a result of the reduction in pumping ordered by the adjudication and increased recharge via the injection wells of the seawater intrusion barrier, in-lieu replenishment and improved underflow from Central Basin, the water levels in the West Coast Basin have slowly recovered to near 1940 levels.

The adjudication of the Central Basin began not out of litigation as in the West Coast Basin, but out of the collective concern expressed by the major pumpers regarding the impacts that reduced groundwater quantity and quality would have on the future of their communities. The Central Basin Municipal Water District was formed in 1952 to distribute supplemental water to the major water purveyors. In 1954 it was annexed to the MWD, so that access to the imported water supplies was available to the region.

The WRD was created in 1959, largely out of cooperation between the West Coast Basin Water Association and the Central Basin Water Association, with the directive to facilitate artificial replenishment of the two basins as a means of eliminating the overdraft and halting seawater intrusion. To quiet the title to and limit production of the groundwater in Central Basin, the WRD

filed a lawsuit in Superior Court, Los Angeles, in 1962 against more than 700 parties. Later that year after a vast majority of the pumpers approved of the approach, the Court adopted an interim agreement to limit the production from the basin. In 1965, following extensive meetings by the parties to work out a settlement that was supported by pumpers representing over 75 percent of the basins anticipated water rights, the court approved the stipulated judgment for the Central Basin.

This judgment established an adjudicated water right for each party, but limited the allowable pumping allocation (APA) to 80 percent of the water right, which equals 217,367 acre-feet annually. The Dominguez Water Company was identified as a party to the judgment and granted water rights. As a result of the merger with Dominguez, Cal Water now owns these 8,100 acre-feet of adjudicated right with the associated 6,480 AFY of APA in the Central Basin. This amount is in addition to the 11,774 acre-feet held by Cal Water’s East Los Angeles District. Table 10 summarizes the Dominguez District’s allowable pumping allocation from the two basins.

Table 10: Cal Water Groundwater Pumping Rights	
Basin	Pumping Rights AFY
Central Basin	6,480.00
West Coast Basin	10,417.45
Total	16,897.45

The principle mechanisms for recharge in the West Coast Basin are injection of water into the seawater intrusion barriers, in-lieu replenishment, and inflow to the West Coast Basin from the Central Basin. The Central Basin is recharged through percolation of water applied to surface spreading ponds in the Montebello Forebay, in-lieu replenishment, and inflow to the Central Basin from the San Gabriel Valley.

The Los Angeles County Department of Public Works owns and operates all groundwater recharge facilities as a county-funded activity through a longstanding inter-agency agreement. As a result, costs associated with the capture and recharge of storm water runoff are not directly accounted for in the cost of water replenishment. All other water used for replenishing the groundwater of the Central and West Coast Basins is funded by the WRD through the Replenishment Assessment. Additionally, the WRD manages various groundwater quality cleanup programs. To finance its designated responsibilities, the WRD levies a Replenishment Assessment on every acre-foot of groundwater produced in the Central and West Coast Basins.

Cal Water’s management plan for Dominguez District water supplies includes participating in existing regional conjunctive-use programs and making use of economic incentives and the lease market to the fullest extent possible.

Basin Boundaries and Hydrology

The West Coast Subbasin is bounded on the north by the Ballona Escarpment, an abandoned erosional channel from the Los Angeles River. On the east it is bounded by the Newport-Inglewood fault zone and on the south and west by the Pacific Ocean and consolidated rocks of the Palos Verdes Hills. The surface of the sub-basin is crossed in the south by the Los Angeles River through the Dominguez Gap, and the San Gabriel River through the Alamitos Gap, both of which then flow into San Pedro Bay.

The Central Subbasin occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin. This subbasin is bounded on the north by a surface divide called the La Brea High, and on the northeast and east by emergent less permeable Tertiary rocks of the Elysian, Repetto, Merced and Puente Hills. The southeast boundary between Central Basin and Orange County Groundwater Basin roughly follows Coyote Creek, which is a regional drainage province boundary. The southwest boundary is formed by the Newport Inglewood fault system and the associated folded rocks of the Newport Inglewood uplift. The Los Angeles and San Gabriel Rivers drain inland basins and pass across the surface of the Central Basin on their way to the Pacific Ocean Bay.

A detail description of the basin is given in the California's Ground Water Bulletin 118, which is included as Appendix G in the Dominguez District 2015 UWMP. Also included in Appendix G are the Central Basin Adjudication Order, West Basin Adjudication Order, and Water Replenishment District of Southern California 2015 Engineering Survey and Report.

Groundwater Management Plan

As the regional groundwater management agency for two of the most utilized groundwater basins in the state of California, the WRD plays an integral role in overall water resource management in southern Los Angeles County. The WRD manages groundwater for nearly four million residents in 43 cities of southern Los Angeles County. The 420 square mile service area uses about 250,000 AF of groundwater per year, which equates to nearly 40 percent of the total demand for water. The WRD ensures that a reliable supply of high-quality groundwater is available through its clean water projects, water supply programs, and effective management principles.

Dominguez District Wells (Groundwater) Summary

Presently, the district has 6 active potable supply wells in the West and Central Basins with a combined production capacity of 6,971 AFY if operated continuously. With a duty factor of 80% annual production is estimated to be 5,577 AFY.

Table 11 is a summary of actual and projected well production for the Dominguez District.

Table 11: Dominguez District Wells Actual and Projected Production			
Well Number	Actual or Projected Capacity (GPM)	Annual Production - 80% Use (AFY)	Year in Service
<i>West Coast Basin Wells</i>			
215-01	598	772	Currently
216-02	1,000	1,290	2022
219-02	1,200	1,548	2025
232-02	837	1,080	2022
275-01	524	676	2022
277-01	521	672	Currently
279-01	1,000	1,290	Currently
294-01	1,000	1,290	2022
298-01	1,216	1,569	Currently
<i>Central Basin Wells</i>			
272-01	800	1,032	2022
290-01	690	890	Currently
297-01	297	383	Currently
300-01*	1,000	1,290	2025
301-01*	1,000	1,290	2025
Total	11,683	15,076	

For 2022 Cal Water projects annual well production of 10,946 AFY and in 2025 15,076 AFY. By 2030, Cal Water plans additional well production capacity to enable it to fully utilize its allowable pumping allocation from the West and Central Basins of 16,987 AFY.

While Cal Water is implementing new well and treatment facilities projects to increase production capacity, it will continue to purchase water to meet the balance of district demands.

Historically, Cal Water lost some well production capacity due to groundwater quality issues and reduced well efficiencies. In 2009, well production capacity was approximately 10,700 AFY. In 2000, Cal Water pumped 14,737 AF or 87 percent of its adjudicated rights.

As indicated in Table 11, Cal Water has new well and well treatment facilities projects that it intends to bring on line by year 2025 and 2025. The 2030 projection for additional well capacity is intended to enable Cal Water to achieve full use of its allowable pumping allocation.

Cal Water provides ongoing maintenance, well rehabilitation and engineering support to maintain production in all of its wells including adding treatment facilities for wells with water quality issues.

Sustainable Groundwater Management Act

On September 16, 2014, Governor Brown signed into law Assembly Bill 1739, Senate Bill 1168, and Senate Bill 1319 (AB-1739, SB-1168, and SB-1319). This three-bill legislative package is known collectively as the Sustainable Groundwater Management Act (SGMA). SGMA was amended in the later part of 2015 by Senate Bill 13, Senate Bill 226 and Assembly Bill 1390 to provide clarity to the original law and guidance on groundwater adjudications. This new legislation defines sustainable groundwater management as the “management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results” [Water Code § 10721(u)]. The legislation defines “undesirable results” to be any of the following effects caused by groundwater conditions occurring throughout the basin [Water Code § 10721(w) (1-6)]:

- Chronic lowering of groundwater levels indicating a significant and unreasonable depletion of supply;
- Significant and unreasonable reduction of groundwater storage;
- Significant and unreasonable seawater intrusion;
- Significant and unreasonable degraded water quality;
- Significant and unreasonable land subsidence;
- Surface water depletions that have significant and unreasonable adverse impacts on beneficial uses of the surface water.

UWMPs prepared by Cal Water since 2005 including the 2015 plan include many of the elements required for SGMA implementation summarized as follows:

- Historic and future customer growth and water demand.
- Historic and future water supplies
- Potential actions Cal Water will need to take to develop additional water supplies to maintain supply reliability
- Water quality and necessary actions to protect and decontaminate water supplies
- Supplementing water supplies with recycled water and desalinated water.
- Projected capability of the supply to reliably serve customer demands under normal, single-dry-year and multiple-dry-year conditions.

The legislation provides for financial and enforcement tools to carry out effective local sustainable groundwater management through formation of Groundwater Sustainability Agencies

(GSA's) consisting of local public agencies, water companies regulated by the CPUC and mutual water companies. The legislation requires that GSA's within High and Medium Priority basins under the California Statewide Groundwater Elevation Monitoring (CASGEM) program subject to critical conditions of overdraft prepare and submit a Groundwater Sustainability Plan (GSP) for the basin by January 31, 2020 [Water Code § 10720.7(a) (1)], and requires GSA's in all other groundwater basins designated as High or Medium Priority basins to prepare and submit a GSP by January 31, 2022 [Water Code § 10720.7 (a) (2)]. Following State approval, the basin would thereafter be managed under the GSP. Intended outcomes and benefits of SGMA include:

- Advancement in understanding and knowledge of the State's groundwater basins and their issues and challenges;
- Establishment of effective local governance to protect and manage groundwater basins;
- Management of regional water resources for regional self-sufficiency and drought resilience;
- Sustainable management of groundwater basins through the actions of GSA's, utilizing State assistance and intervention only when necessary;
- All groundwater basins in California are operated to maintain adequate protection to support the beneficial uses for the resource;
- Surface water and groundwater are managed as "a Single Resource" to sustain their interconnectivity, provide dry season base flow to interconnected streams, and support and promote long-term aquatic ecosystem health and vitality;
- A statewide framework for local groundwater management planning, including development of sustainable groundwater management best management practices and plans;
- Development of comprehensive and uniform water budgets, groundwater models, and engineering tools for effective management of groundwater basins;
- Improved coordination between land use and groundwater planning;
- Enforcement actions as needed by the SWRCB to achieve region-by-region sustainable groundwater management in accordance with the 2014 legislation.

To assist in attaining the above outcomes, the California Department of Water Resources (DWR) will provide GSA's with the technical and financial assistance necessary to sustainably manage their water resources. The benefits of these outcomes include:

- A reliable, safe and sustainable water supply to protect communities, farms, and the environment, and support a stable and growing economy;

- Elimination of long-term groundwater overdraft, an increase in groundwater storage, avoidance or minimization of subsidence, enhancement of water flows in stream systems, and prevention of future groundwater quality degradation.

Cal Water works collaboratively with other basin stakeholders for sustainable management of groundwater including sharing costs and benefits on an equitable basis. Cal Water recognizes the challenges of the legislation in terms of technical, legal, political, and financial/economic issues and is taking an active role in local and state-wide management of groundwater resources. Any changes to allowable pumping made by the Groundwater Sustainability Agency and the GSP could affect the amount of groundwater that Cal Water is allowed to pump in the future. The GSP is to be completed by January 31, 2020.

Recycled Water

Although Los Angeles County Sanitation District's (LACSD) Joint Water Pollution Control Plant (JWPCP) provides wastewater collection and treatment services for the Dominguez service area, recycled water comes from WBMWD's West Basin Water Recycling Facility (WBWRF). The source of water to that facility is secondary effluent from the City of Los Angeles' Hyperion Wastewater Treatment Plant, which provides secondary treatment using the activated sludge process. Most of the Hyperion treated effluent is disposed of through an ocean outfall. Approximately six percent of treated effluent goes to the WBWRF in El Segundo where it undergoes chemical clarification, recarbonation, microfiltration, and chlorination. The WBWRF produces 42,000 AFY (37.5 mgd) of recycled water and has a maximum capacity of 67,210 AFY (60 mgd).

WBMWD has one of the largest recycled water programs in the United States. WBMWD has identified over 105 economically feasible recycled water users. Fully implemented, the recycling program has the potential to use over 67,210 AFY of recycled water. In the Dominguez system, Cal Water began purchasing recycled water from WBMWD in 2000 for industrial process waters and landscape irrigation. WBMWD and Cal Water's plan is to increase use of recycled water with as new customers as WBMWD's distribution system is expanded. This will result in less potable water use where that water is being used for those purposes.

Recycled water from the WBWRF is used for groundwater replenishment through more than 100 injection wells. In addition to serving Cal Water the WBWRF provides recycled water to more than 140 sites in Manhattan Beach, Torrance, Hermosa Beach, Carson, and Inglewood. Its biggest customers are the Chevron, Mobil and BP oil refineries. It should be noted that Cal Water operates and maintains the recycled water distribution system under contract to WBMWD. Figure 7 shows the 2009 transmission system.

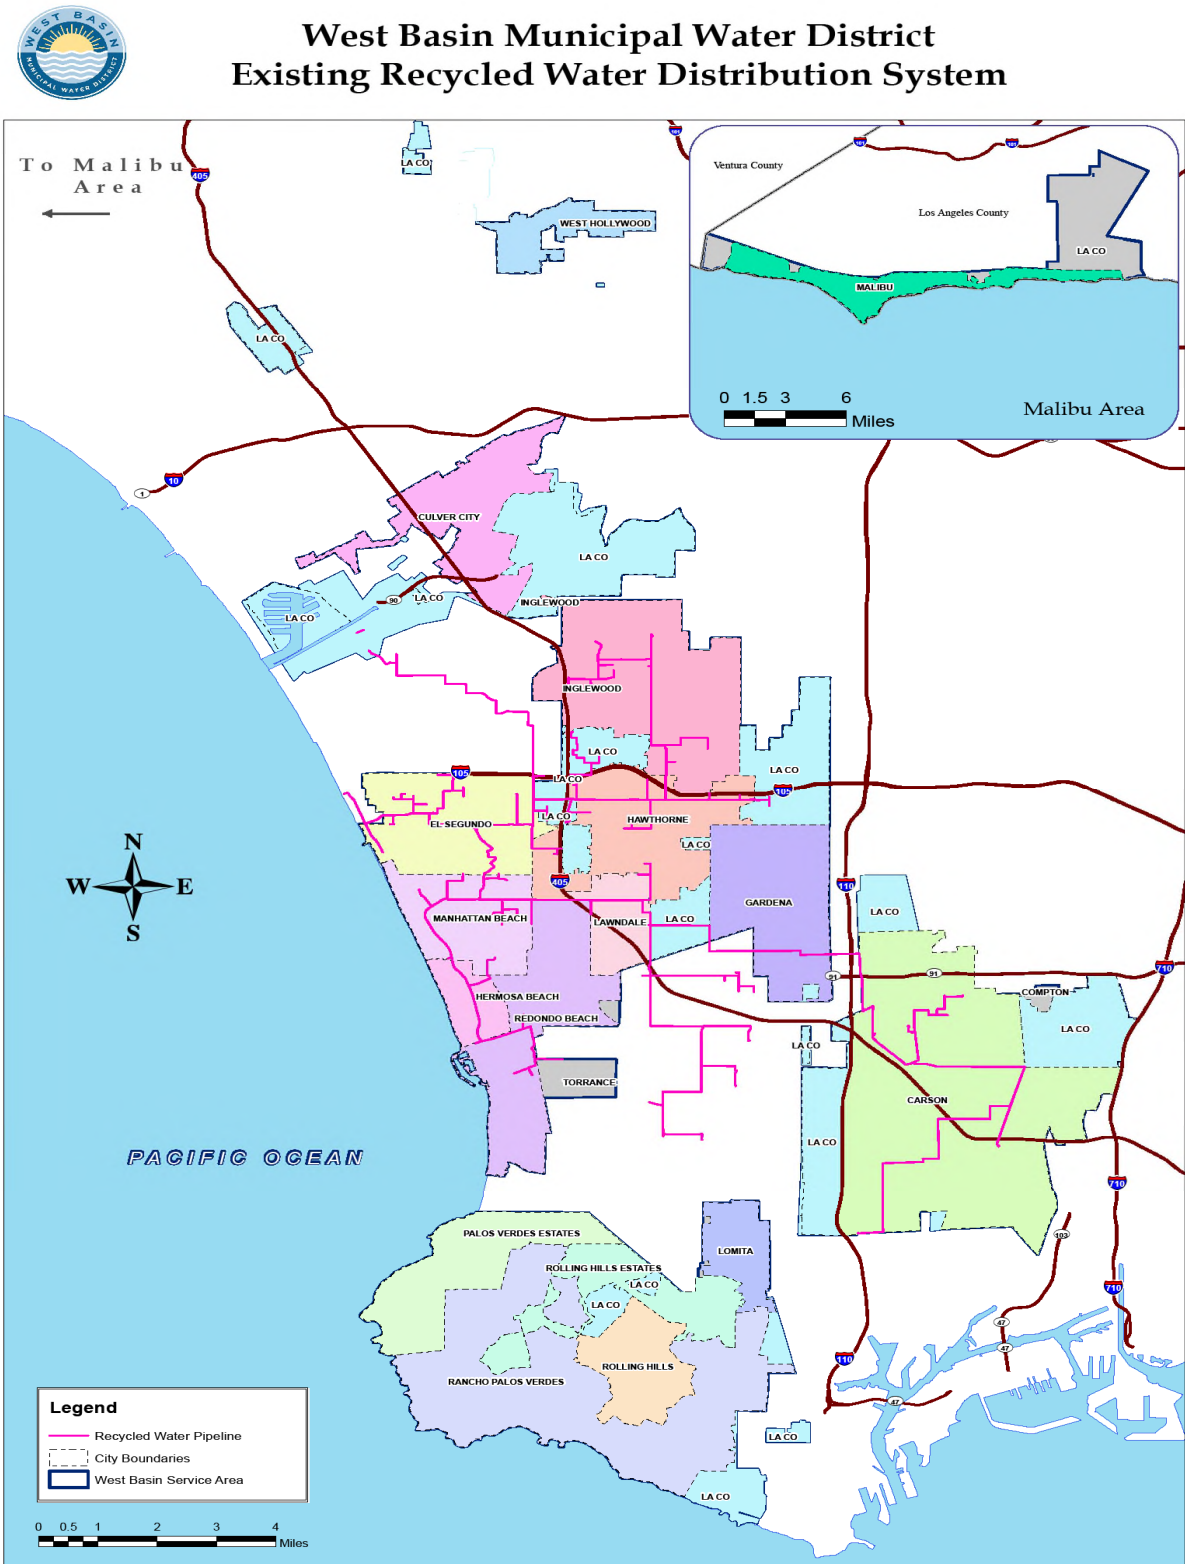

WBMWD is responsible for:

- Determining the technical and economic feasibility of supplying recycled water to the Dominguez service area
- Encouraging the use of and optimizing the use of recycled water in the Dominguez service area
- Extension of recycled water lines within the Dominguez service area

Cal Water actively supports use of recycled water by its customers and offers recycled water at a reduced cost. WBMWD has identified over 105 feasible recycled water users with a combined

estimated average annual demand of 19,100 AFY. In 2015, Cal Water supplied 5,089 AF of WBMWD recycled water to 11 customers in the Dominguez system. Examples of recycled customers include the BP/ARCO refinery, the Home Depot sports complex with numerous soccer fields, and the Cal State University Dominguez Hills campus.

Figure 7: WBMWD Recycled Water Transmission System

The WBMWD Water Recycling Master Plan identifies potential customers in the Dominguez service area. Currently there are eleven customers that use recycled water. WBMWD's recycling plan includes several projects to install pipelines capable of delivering recycled water throughout the Harbor/South Bay area.

Estimates of increased use of recycled water in WBMWD's Water Recycling Master Plan (WRMP) are quite high when compared to what has actually occurred in the Dominguez District. The WRMP assumes several large water users will switch to recycled water rather than pump groundwater for which they hold water rights at a cost nearly double the cost of groundwater. The WRMP anticipates large uses of recycled water by several industrial customers for processes for which use of recycled water has not been demonstrated. Hence, for the Dominguez District, Cal Water uses a lower growth projection than WBMWD. Cal Water's projected increase in recycled water use from 6,081 AFY in 2015 to 11,800 AFY in 2040 or an increase of 5,719 AFY in 25 years (229 AFY per year increase) can be considered to be conservative when compared to the projections in WBMWD's Water Recycling Master Plan.

Desalinated Water

Desalted Brackish Groundwater

Seawater intrusion into the groundwater of the West Coast Basin has been a problem since the 1930s. Two seawater intrusion barriers, the West Coast Basin Barrier and the Dominguez Gap Barrier, have been constructed and put into operation to stop salt water intrusion. The Los Angeles County Department of Public Works is responsible for maintenance of these barriers and the WRD provides freshwater that is injected into these barriers. A large amount of brackish water still lies inland of the saltwater barriers. It is being removed by extraction wells and treated at the C. Marvin Brewer Desalter, a reverse osmosis treatment plant that started operating in 1993. Dominguez Water Corporation, with the support of the WBMWD, WRD, MWD, and the US Bureau of Reclamation established the desalter project. Its costs of operation are reduced through a MWD incentive program so that the unit cost of desalinated brackish water is slightly less than non-interruptible imported freshwater from MWD. Since the merger of Cal Water and Dominguez Water Corporation in 2000, Cal Water has operated the desalter project.

Desalinated Ocean Water

In 2014, WBMWD completed an ocean water desalination demonstration project at the L.A. Conservation Corps' SEA Lab facility in Redondo Beach for the purpose of developing and collecting data for planning, permitting, design, construction, and operation of a full-scale desalination facility. The demonstration plant used full-scale equipment to assess operating factors, evaluate alternative processes and assess water quality and energy efficiency. Based on the results of the study, WBMWD determined that building a full-scale desalination plant is feasible.

1. WBMWD intends to build a 20 mgd desalination plant in El Segundo (expandable to 60 mgd) because that location offers many advantages and has none of the significant issues associated with the demonstration plant site in Redondo Beach. Because of the extensive permitting and approval requirements, conducting the necessary environmental and scientific field studies, preparing the necessary draft and final documents, obtaining funding, designing, constructing, testing and commissioning of all new facilities could take at least 10 years to complete.

2. WBMWD plans on determining Cal Water's interest in participating in its El Segundo desalination plant in terms of supply, costs and other factors. Cal Water is considering this option.
3. The research completed by WBMWD at the Redondo Beach demonstration plant could provide useful information to Cal Water in locating possible treatment plant sites and in developing a preliminary feasibility assessment should Cal Water elect to pursue its own desalination project. An in-depth technical, environmental, permitting and cost analysis would be required to provide the information needed to decide whether or not it was feasible for Cal Water to move forward with its own desalination project.

Transfer or Exchange Agreements

Both the West Coast Basin and Central Basin judgments allow for transfer of groundwater rights through sale or lease agreements between parties and for the carryover of unused rights in an amount up to 20 percent of the groundwater rights held by a party. DWR is the designated Watermaster for both the West Coast Basin and Central Basin Adjudications. In that capacity, DWR accounts for all groundwater production in the basin, and annually reports on groundwater production and related groundwater-use transactions. The parties must file monthly production reports and notify the Watermaster regarding all leases or sales of rights.

The lease or purchase of additional adjudicated water rights could be used to increase supply reliability and availability. Obtaining additional adjudicated rights would further increase the savings available to the system under MWD's seasonal service program. Hence, the Dominguez system's program for increasing reliable groundwater production capacity of its wells to fully utilize all of its existing adjudicated rights and those of other agencies when opportunities become available. In the past 12 years, Cal Water has leased some of its adjudicated rights in both basins on a short-term basis to other agencies that had production capacity and had the need for more water. As Cal Water increases its well production capacity, it will not renew these leases. Cal Water has had several short-term leases with local municipalities and private companies to use their available excess groundwater allocations for supply and will evaluate negotiating new leases as Dominguez District well capacity increases and full use of Cal Water's allowable pumping allocation is achieved.

Future Water Supply

Cal Water's plan for the Dominguez District and its three neighboring districts is to continuously provide adequate reliable supplies through facilities that meet peak demand requirements and have sufficient reserve capacity for fire protection. Cal Water recognizes that water supply planning is an ongoing process that requires regular reviews of assumptions and conditions.

The reliability of MWD imported water supplies has been affected by a number of factors in recent years, so MWD has implemented several programs to improve supply reliability:

- Financial incentives for development of local supplies
- Use of imported supplies on a seasonal basis and in a manner that maximizes the importation of supplies into Southern California
- Storage for surplus imported supplies for future use
- Restore use of local groundwater that have been contaminated

Cal Water will evaluate prospective additional supply projects and regional supply conditions to include:

- Status of West Coast and Central Basin groundwater basin storage, availability of groundwater and utilization of adjudicated water rights
- Transfer Agreements with other utilities that hold adjudicated groundwater rights in the two basins and have surplus water rights available
- Status and maintenance of seawater intrusion barriers managed by the Los Angeles County Department of Public Works
- Increased participation in WBMWD's water recycling program in the Dominguez and adjacent systems.
- Possible participation in WBMWD's desalination treatment project.

Cal Water coordinates its supply planning activities with other purveyors who are served by WBMWD. Cal Water participated in the development of the WBMWD Water Shortage Contingency Plan. Proposed Programs in this plan include:

- West Coast Basin Judgment Work Group - Representatives of the West Coast Basin Water Association are developing possible amendments to provide more flexible operations during drought, expansion of storage and conjunctive operation of the basin, and innovative water management practices.
- Water Supply and Drought Management Planning.
- Implementation of the Best Management Practices through a Memorandum of Understanding.
- West Coast Basin Reclamation Program.
- West Coast Basin Saline Plume Mitigation Planning.

While Cal Water recognizes that MWD and WBMWD are committed to providing reliable and affordable imported water supplies, it also recognizes that as water demand increases the potential for water shortages does also. MWD's and WBMWD's objective is to provide 100 percent supply reliability over the next twenty years to meet all non-discounted, non-interruptible demand in the region. MWD initiatives to ensure this reliability include the Integrated Resource Plan (IRP), the Water Surplus and Drought Management Plan (WS&DMP) and the Local Resource Investments program.

As indicated previously, Cal Water is committed to implementing new programs and projects in increasing water conservation, expanding use recycled water and maximizing use of its groundwater rights to decrease reliability on MWD supplied water.

Supply Adequacy and Reliability Assessment

This section combines and compares previously presented information on projected demand and supplies for the Dominguez District to address the question of whether Dominguez system supplies are adequate and reliable for the next 20 years for normal hydrologic conditions, one dry year and a multiple dry year period.

Normal Water Year

Groundwater supply is limited to Cal Water’s allowable pumping allocation and by well production capacity. As explained previously, Cal Water is installing new wells to increase pumping capacity and adding wellhead treatment to existing wells with water quality issues. Cal Water plans to maximize use of its allowable pumping allocation by 2030. Recycled water supply is matched to expected demand from this source. If some industrial customers in the Dominguez District were to convert their process water use to recycled water sooner, this would decrease potable water demand and make existing potable supplies available for future growth.

Cal Water’s combined projected purchased water for all four of its districts receiving WBMWD water will be below its Tier I maximum of 70,000 AFY in normal hydrologic years.

According to MWD’s 2010 Regional Urban Water Management Plan, sufficient supplies of imported water will be available in normal hydrologic years to meet all projected demands.

Table 12 compares demand with supply for a normal hydrologic year and demonstrates adequacy of supply to meet demands.

Table 12: Dominguez District: Normal Hydrologic Year Supply and Demand Comparison (AF)						
	2015	2020	2025	2030	2035	2040
Purchased water	26,908	29,219	16,457	14,811	15,124	15,324
Groundwater	4,405	5,577	15,076	16,897	16,897	16,897
Recycled water	6081	7,950	8,800	9,700	10,700	11,800
Supply totals	36,394	39,458	40,333	41,408	42,721	44,021
Demand totals	36,394	39,458	40,333	41,408	42,721	44,021
Difference	0	0	0	0	0	0

Single Dry Year

Cal Water projects no decrease in total supply available and that it will meet projected demands. As noted in the previous section, groundwater and recycled water are expected to be available in the quantities projected and are not affected by a dry year. MWD’s Regional Urban Water Management Plan indicates sufficient supplies of imported water will be available in single dry years to meet all projected demands. MWD indicates that the policies in its 2010 and 2015 IRP updates will ensure this reliability. Therefore, the supply is projected to be meet demand during a single dry year as shown in Table 13.

Table 13: Single Dry Year Supply and Demand Comparison (AF)						
	2015	2020	2025	2030	2035	2040
Purchased water	26,908	29,219	16,457	14,811	15,124	15,324
Groundwater	4,405	5,577	15,076	16,897	16,897	16,897
Recycled water	6081	7,950	8,800	9,700	10,700	11,800
Supply totals	36,394	39,458	40,333	41,408	42,721	44,021
Demand totals	36,394	39,458	40,333	41,408	42,721	44,021
Difference	0	0	0	0	0	0

Multiple Dry Year Period

Because of adequate existing groundwater basin storage volume and ongoing regional groundwater recharge programs, groundwater supply is considered reliable. Therefore, Cal Water will be able pump up to its annual APA based on need and well production capacity. The quantity of recycled water to be delivered in the Dominguez system during a multiple dry year period is expected to be the same as that delivered during a normal hydrologic year.

MWD's 2010 Regional Urban Water Management Plan indicates that sufficient supplies of imported water will be available during multiple dry years to meet all projected demands. MWD believes that the policies in the 2010 and 2015 IRP updates will ensure reliability.

In 2035, the full estimated increase in potable demand for the CSUDH CMP is projected to occur. Hence, the analysis for a multiple dry year period is based on three dry years following 2035.

For the first dry year (2036), no change in supply or demand is projected. Demand for 2036 is estimated to be a 1/5 of the increase in the demand between 2035 and 2040 or 40 AF.

On the conservative side, it is assumed that the quantity of purchased water delivered to the Dominguez District by WBMWD is reduced by 10% in the 2nd dry year (2037) and by 20% in the 3rd dry year (2038).

As previously noted, in the Imported Water Purchase Agreement between Cal Water and WBMWD, the Base Allocation, Tier Allocations, and Purchase Commitment are established as a combined amount for the three Cal Water districts (Palos Verdes, Hermosa-Redondo, and Dominguez) and the Hawthorne service area. The Dominguez District shares in the combined amount with the other two districts and the Hawthorne service area. Amendment No. 4 to the Agreement eliminated Cal Water's Base Allocation and set the Tier 1 Annual Maximum to 70,000 AF and a total Purchase Commitment to 210,000 AF. Cal Water's allocation of its Tier 1 Annual Maximum among its 3 districts and the Hawthorne service area is: Dominguez 22,400 AF, Hawthorne 4,900 AF, Hermosa-Redondo 16,800 AF, and Palos Verdes 25,900. So the Dominguez District gets 32% of the total. For the Purchase Commitment of 210,000 AF, the Dominguez District's proportional amount is 67,200 AF.

In 2015, the Dominguez District's actual use of MWD purchased water was 26,908 AF.

A 10% reduction of purchased supply based on 2015 use of 26,908 AF is 2,690 AF or available

supply would be 24,217 AF. The 2037 estimate of purchased water is 15,204 AF which is 9,013 AF less than the 2015 reduced amount.

For the 3rd year, a 20% reduction in purchased water would equal 5,382 AF of the 2015 purchased water or available supply would be 21,526 AF. The 2038 estimate of purchased water is 15,244 AF which is 6,282 AF less than the 2015 reduced amount.

Table 14 shows that even if there were cut backs in MWD supply of 10 percent and 20 percent as assumed, it would have no effect on the adequacy of Dominguez District supplies to meet projected normal demands during a multiple dry year period.

Table 14: Multiple Dry Year Period Supply and Demand Comparison: 2nd & 3rd Years AFY				
Water Supply	2035 Normal Water Year Water Supply	Multiple Dry Water Year Water Supply		
		2036 -1st Year	2037 – 2nd Year	2038 – 3rd Year
Purchased	15,124	15,164	15,204	15,244
Recycled	10,700	10,700	10,700	10,700
Groundwater	16,897	16,897	16,897	16,897
Total Supply	42,721	42,761	42,801	42,841
Demand	42,721	42,761	42,801	42,841

During dry years when deliveries from the Colorado River Aqueduct and the State Water Project (SWP) are reduced, MWD can draw water from other storage areas established through groundwater banking and transfer agreements made with other agencies. These agreements are further described in MWD’s Water Surplus and Drought Management Plan (WSDM Plan).

Summary and Conclusion

Based on:

- Adequacy of existing and planned supplies from WBMWD and MWD,
- Plans to construct new wells and maintain existing wells including constructing treatment facilities to address water quality issues where needed in order to fully utilize its adjudicated groundwater rights,
- Plans to continue to participate in MWD’s in-lieu storage program for increasing basin groundwater storage for use during drought periods,
- Plans to increase use of recycled water from WBMWD,
- In-place, ongoing and planned expanded water conservation programs and best management practices for reducing demand during normal and single and multiple dry years,
- Continuing participation in regional supply programs sponsored by WBMWD and MWD,
- Success in obtaining increased reductions in water use during multiple dry years by implementing its four-stage water demand reduction program, and
- Over ninety years of experience in continuously providing an adequate supply to meet demands during normal, single and multiple dry years in the Dominguez District,

Cal Water concludes that for the next 20 years (2020 – 2040), the Dominguez District will have adequate water supplies to meet projected demands associated with the proposed CSUDH Campus Master Plan and those of all existing customers and other anticipated future customers for normal, single dry year and multiple dry year conditions.
